A robotic system was developed to automate the die attachment electrical testing performed on a specific diode. An industrial robot was integrated with electrical test equipment and a non-destructive tensile tester to verify the integrity of the lead attachment to the diode die. Robotic manipulation is employed to route the diodes through the testing and bin sorting operations. 4 refs., 6 figs.

45867 (SAND–88-1765) **A comparison of fixed-base and driven-base modal testing of an electronics package.** Carne, T.G.; Martinez, D.R.; Nord, A.R. Sandia National Labs., Albuquerque, NM (USA). Aug 1989. 27p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89016673/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper compares results for a fixed-base and a driven-base modal test of an electronics package. A fixed-base modal test uses the common testing procedure of attaching the structure to a large inertial mass which is freely suspended. The problem with this approach is that the input levels are typically limited by the strength of the structure and stinger attachment. An attractive alternative to fixed-base modal testing is to use high force shaker-tables to provide a driven-base input. Some of the issues of concern are: properly simulating the fixed boundary conditions, applying modal estimation algorithms to motion-to-motion frequency response functions vs. motion-to-force frequency response functions, non-linearity effects and testing at very low input levels vs. levels equal to those of the field environment, complications involved with shaker resonances, exciting the "response-critical" modes of the structure, and consistency of the modal parameters using driven-base tests vs. fixed-base modal tests. Experimental results are presented which demonstrate the adequacy of using vibration shake tables to excite the fixed-based modes of the system. A direct comparison of the modes acquired using fixed-base and driven-base excitation for the electronics package shows very close agreement. A discussion of the theory for driven-base testing is given, as well as a brief presentation of analytical predictions for the structure. 4 refs., 11 figs., 1 tab.

45868 (SAND–89-0544C) **Mechanical states in wound capacitors: Part 1, Prediction.** Reuter, R.C. Jr.; Allen, J.J. Sandia National Labs., Albuquerque, NM (USA). 1989. 20p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC04-76DP00789. (CONF-890987–1: ASME design conference, 17-20 Sep 1989). Order Number DE89008110/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The problem of determining the mechanical states inside wound capacitor rolls is addressed through the application of two dimensional, linear elasticity. Allowances are made for heterogeneous wound construction of the capacitor, orthotropic material behavior of the capacitor constituents, and arbitrary winding tension. A key element in the formulation is the derivation of material properties for a wound, orthotropic layer which is equivalent in behavior to a stack of dissimilar plies such as are actually wound on the capacitor simultaneously during one turn of the mandrel. The dissimilar plies are necessary by virtue of the conductor and dielectric materials which must be present in a capacitor. The derivation of predictive equations is based on winding the equivalent layer on an appropriate mandrel, followed by a recovery of the individual ply responses. The capability to explicitly calculate the winding tensions which

would be necessary to produce a required wound tension dependence upon capacitor radius is also developed. Numerical results for typical capacitor design and construction are presented, and justification for the application of optimization theory in capacitor development is demonstrated. 4 refs., 5 figs.

45869 (SAND–89-0841C) **ASIC [Application Specific Integrated Circuit] replacement for an SSI [Small Scale Integrated] component design a case study.** Everts, J.; Gelet, D.; Deatherage, D.; Contreras, M. Sandia National Labs., Albuquerque, NM (USA). 1989. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909146–1: 2. annual IEEE/ASIC seminar and exhibit, 25-28 Sep 1989). Order Number DE89013494/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This case study covers the practical issues of design-for- functionality, design-for-simulation, and design-for-testability in replacing aging SSI component designs with ASIC gate arrays. The replacement of a 169-TTL-component design with a CMOS ASIC gate array is presented. Maintaining existing functionality is accomplished through a series of ordered conversion steps that minimize the probability of error in the conversion. Design modifications, such as the addition of initialization circuitry, were necessary to take advantage of CAE simulation tools. The faster ASIC technology coupled with design modifications allowed the time-to-simulate to be decreased by a factor of 10,000. A unique pseudo-random number generation/signature analysis technique is presented that interrogates highly sequential designs. The testability scheme and other design techniques improved stuck-at fault coverage by more than 640%. The economic advantages, knowledge gained, and the tools developed that are applicable to future design work are also discussed. 12 figs.

45870 (SAND–89-1625C) **Circuit level modeling of inductive elements.** Muyshondt, G.P.; Portnoy, W.M. Sandia National Labs., Albuquerque, NM (USA). 1989. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890815–18: 24. intersociety energy conversion engineering conference, 6-11 Aug 1989). Order Number DE89015122/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Design and analysis of spacecraft power systems have been difficult to perform because of the lack of circuit level models for nonlinear inductive elements. This paper reviews some of the models which have been proposed, their limitations, and applications. An improved saturation dependent model will be described. The model has been implemented in SPICE and with a commercial circuit program and demonstrated to be satisfactory in both implementations. 3 refs., 9 figs.

45871 (UCRL–100525) **Micro-cavity integrable vacuum diodes and triodes.** Orvis, W.J.; McConaghy, C.F.; Ciarlo, D.R.; Yee, J.H.; Hee, E.W.; Hunt, C.E.; Trujillo, J. Lawrence Livermore National Lab., CA (USA). Jul 1989. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8907121–1: 2. international conference on vacuum microelectronics, 24-26 Jul 1989). Order Number DE89016649/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We are developing miniature, vacuum, field emission diodes, and triodes for use in electronics in hazardous environments. We have produced the structures for micrometer sized diodes and triodes. We are currently improving the emission rate of the field mission electron source, before inserting it into the diode and triode structures. 3 refs., 6 figs.

45872 Modular multimorphic kinematic arm structure and pitch and yaw joint for same. Martin, H.L.; Williams, D.M.; Holt, W.E. To Dept. of Energy, Washington, DC. USA Patent 4,828,453. 9 May 1989. Filed date 21 Apr 1987. vp. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

A multimorphic kinematic manipulator arm is provided with seven degrees of freedom and modular kinematic redundancy through identical pitch/yaw, shoulder, elbow and wrist joints and a wrist roll device at the wrist joint, which further provides to the manipulator arm an obstacle avoidance capability. The modular pitch/yaw joints are traction drive devices which provide backlash free operation with smooth torque transmission and enhance rigidity. A dual input drive arrangement is provided for each joint resulting in a reduction of the load required to be assumed by each drive and providing selective pitch and yaw motions by control of the relative rotational directions of the input drive.

45873 Method for controlling gas metal arc welding. Smartt, H.B.; Einerson, C.J.; Watkins, A.D. To Dept. of Energy, Washington, DC. USA Patent 4,825,038. 25 Apr 1989. Filed date 10 Aug 1987. 9p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

The heat input and mass input in a Gas Metal Arc welding process are controlled by a method that comprises calculating appropriate values for weld speed, filler wire feed rate and an expected value for the welding current by algorithmic function means, applying such values for weld speed and filler wire feed rate to the welding process, measuring the welding current, comparing the measured current to the calculated current, using the comparison to calculate corrections for the weld speed and filler wire feed rate, and applying corrections.

45874 (CMHC–870120) **Residential combustion venting failure. A systems approach. Final technical report. Project 5: Remedial measures for wood-burning fireplaces.** Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1987. vp. (CE–02736). Available from Canada Mortgage and Housing Corporation, Annex Bldg., 628 Montreal Rd., Ottawa, ON, CAN K1A 0P7; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report is a review of remedial measures available for avoiding or correcting combustion venting problems in wood-burning fireplaces and included on account of field tests of airtight doors with direct air supply and of a fireplace spillage advisor. It appeared that properly designed, truly airtight doors are effective in isolating fireplaces from the house indoor pressure regime and that this remedial measure does not affect the fire safety of the fireplace. It was also found that the detection of smoke particles was effective when the fire was hot and flaming, but not during the smoldering stage of the fire; on the other hand, the detection of carbon monoxide was not effective during the hot and flaming stage, but was effective during the smoldering stage. It is, therefore, necessary, for a fireplace spillage advisor to incorporate both technologies. The design and optimum location of a fireplace spillage advisor are discussed. A list of fires due to burning solid fuel in British Columbia during the year of 1985 in given, together with their assumed causes. 6 figs., 2 tabs.

45875 (EGG-M–89123) **NO_x emission characteristics of industrial burners and control methods under oxygen enriched combustion conditions.** Kobayashi, Hisashi; Silver, L.S.; Kwan, Yul; Chen, Shin L. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 19p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8905204–1: International flame research foundation, 24-26 May 1989). Order Number DE89016358/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

Flame characteristics and emissions of NO_x were measured for four different industrial burners in two test furnaces for firing rates between 0.5 and 10 x 10^6 Btu and furnace temperature between 2000 and 2700°F. Both natural gas and No. 6 fuel oil were used. Oxygen concentration of enriched air was varied from 21 to 100%. NO_x emissions with natural gas increased sharply from 0.1 to over 1.85 lb/10^6 Btu at a constant furnace temperature was raised from 2000 to 2700°F the NO_x emissions at 35% O_2 rose about 24%. NO_x emissions diminished with increasing oxygen concentration above 50% O_2 for two oxy-fuel burners due to the rate controlling effect of nitrogen concentration. NO_x emissions of 0.36 to 0.48 lb/10^6 BTU were observed for a high flame temperature oxy-fuel burner at 90 to 100% Btu O_2 and 2000-2700°F furnace temperatures. NO_x concentration as low as 0.01 lb/10^6 Btu was measured for a low flame temperature oxy-fuel burner at 100% O_2 and

2000°F furnace temperature. No_x emissions with No. 6 fuel oil containing 0.54% nitrogen were measured for an air burner and an oxy-fuel burner at 2000°F. Relatively small effect on NO_x emission was observed for the air burner. 12 refs., 11 figs. , 1 tab.

45876 (ICST–434053) **Predictive experience of CCRL tunnel furnace for powdered coal firing.** Lockwood, F.C.; Rizvi, S.M.A. Imperial Coll. of Science and Technology, London (UK). 1983. 63p. (MICROLOG–89-02635). Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1. $3.40 CAN minimum, plus $0.25/p after 10 pages; MF $10 CAN.

A prediction procedure has been developed for particulate coal firing of a tunnel furnace. Modifications are incorporated in the particle tracking subcode of this procedure which significantly enhance its computer economy relative to earlier codes. It is concluded that the base case model which has formed the basis of many previous predictions, offers a reasonable simulation of the furnace with a Alberta bituminous coal. However, since individual devolatilization and char burn out models have developed with reference to particular coals, there is a need to explore further the universality of these recommendations. Thus far, it is shown that a useful degree of universality seems to be contained by the best of the present devolatilization and char burn out models. The devolatilization and char burn out phenomena appear to be the critical ones for pulverized coal modelling. They depend on many complex factors and have so far been insufficiently explored. On the whole, the predictions of the one data set considered have been good enough to allow the present predictive tool to be used to explore the performance of the tunnel furnace for operating conditions for which measurements are not currently available. 30 refs., 14 figs., 4 tabs.

45877 (NBNRE–8810, pp. 18) **Fuel handling systems for wood-fired heating plants.** Piercy, J.F. (ADI Ltd.). New Brunswick Dept. of Natural Resources and Energy, Fredericton, NB (Canada). Minerals and Energy Div. 1988. (CONF-8810421–: Wood energy symposium, 25-26 Oct 1988; MICROLOG–89-02885). In *Wood energy symposium. Proceedings.* Available from New Brunswick Legislative Library, Government Documents Section, 766 King Street, Fredericton, NB, CAN E3B 5H1; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The subject of this paper is the design and performance of wood handling systems in use in institutional heating plants in the Province of New Brunswick; seven plants have been selected for examination. Screw conveyors, drag chain conveyors, Patz conveyors, belt conveyors, scraper bins, chain flail bins and screw stokers are discussed. General requirements for any wood handling equipment are a very rugged construction and accessibility. Weak points in existing plants have been identified and remedial measures are proposed.

45878 Apparatus having inductively coupled coaxial coils for measuring buildup of slag or ash in a furnace. Mathur, M.P.; Ekmann, J.M. To Dept. of Energy, Washington, DC. USA Patent 4,829,246. 9 May 1989. Filed date 20 Feb 1987. vp. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

The buildup of slag or ash on the interior surface of a furnace wall is monitored by disposing two coils to form a transformer which is secured adjacent to the inside surface of the furnace wall. The inductive coupling between the two coils of the transformer is affected by the presence of oxides of iron in the slag or ash which is adjacent to the transformer, and the application of a voltage to one winding produces a voltage at the other winding that is related to the thickness of the slag or ash buildup on the inside surface of the furnace wall. The output of the other winding is an electrical signal which can be used to control an alarm or the like or provide an indication of the thickness of the slag or ash buildup at a remote location.

45879 (CMEL–W62-11-88-5-1E) **Ice forces on marine structures. Vol. 1, calculations.** Morrison, T.B.; Marcellus, R.W.; Allyn, N.F.B.; Tseng, J. C.M.E.L. Enterprises Ltd., Spencerville, ON (Canada). 1987. 132p. Available from Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Intended for engineers engaged in designing and building large structures in ice-covered waters, this report provides detailed procedures and equations for predicting ice loads under various conditions and scenarios. Brittle failure of first-year and multi-year ridges and sheets, buckling failure of first-year sheets and floes, and ductile failure of an ice sheet surrounding a structure are included. Guidelines are provided for calculating ice forces on four generic types of marine structures: vertical-sided structures, sloping structures, floating structures, and artificial islands. For each type, and general approach to the work is described followed by an example from Canadian experience. All methods described in the report use analytic or numerical models based on estimated mechanical properties of ice. A detailed discussion and state-of-the-art review of methodologies in current use is provided in the companion volume. 60 refs., 47 figs., 8 tabs.

45880 (CMEL–W62-11-88-5-2E) **Ice forces on marine structures. Volume 2, discussion.** Marcellus, R.W.; Morrison, T. B.; Allyn, N.F.B.; Croasdale, K.R.; Iyer, H.S.; Tseng, J. C.M.E.L. Enterprises Ltd., Spencerville, ON (Canada). [1988]. 436p. (MICROLOG–89-02031). Available from Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A comprehensive state-of-the-art review is provided of the current methodologies in use for estimating the impact of ice forces on various kinds of marine structures: vertical sided or sloping stationary structures, floating structures, and artificial islands. Introductory chapters present ice statistics from selected Canadian marine regions, the failure modes and mechanical properties of ice, and general principles of ice/structure interactions. The methods for calculating ice loads are basically alternative methods for predicting the behavior of ice under different loading conditions; as such, none of the models have been successful in predicting the behavior of ice under all loading conditions. Currently the only reliable method for accurately predicting ice forces on marine structures is to use large-scale empirical data for ice of the same state as that predicted for design. Extrapolation from ice behavioral data at a smaller scale or ice of a different state is generally required. In comparison to current uncertainties, reasonably accurate estimates of upper bound static ice forces can be made, and a design approach using this upper bound force is appropriate for very massive rigid structures and in designing for overall global stability. The periodicity of ice forces also needs to be considered in terms of dynamic amplification of structure deformation, potential liquefaction of soils, and fatigue life. In certain cases, the deflection of the structure can change the ice failure process and therefore change the level and nature of the ice force. 221 refs., 171 figs., 19 tabs.

45881 (CRA–W62-11-88-8-9E) **Measurement of the properties of broken ice zones and ice rubble.** Croasdale, K.R. Croasdale (K.R.) and Associates, Calgary, AB (Canada). 1988. 118p. (MICROLOG–89-02021). Available from Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Broken ice zones and ice rubble areas are very common in the offshore northern environment, for example around offshore structures and in nearshore zones. Improved understanding of the bearing capacity and lateral load transfer of broken ice and rubble could lead to improved efficiencies in, for example, offshore structure design and the use of such ice as drilling pads or protective barriers. A research project was conducted to measure the properties of ice rubble and broken ice, focusing on the refreezing of ice rubble after its formation. A time-dependent settlement test on grounded ice rubble was also performed. Measurements were conducted in the Arctic at a grounded rubble field around an artificial

island in the Beaufort Sea, and in a large outdoor ice basin test facility in Alberta. The measurements were compared with the results from analytical models. Ice basin measurements were in good agreement with these models, in contrast with the field measurements. The latter were less easily performed and the results did not consistently agree with the analytical model for the refreezing of ice rubble. Explanations for the lack of agreement may have been due to such factors as porosity, settlement of rubble, snow cover, local winds, and the approximate nature of rubble porosity measurements. 3 refs., 33 figs., 10 tabs.

45882 (DNV/C–W62-11-88-2E) **Probabilistic framework for ice loads on fixed marine structures. Vol. 2, user's guide to load computer package.** Nessim, M.; Cormeau, A. Det Norske Veritas (Canada) Ltd. (Canada). 1988. 97p. (MICROLOG–89-02022). Available from Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A computer program package has been developed to calculate global and local ice loads on fixed marine structures under Canadian conditions. This document describes the overall features and structure of the package, and provides information on files and file handling, and running the programs. The package is capable of handling vertical sided structures with cylindrical or flat sides (i.e. circular or polygonal in plan), or upward and downward breaking cones (except in landfast zones or in the Grand Banks area, where they are not allowed). A number of ice load scenarios are able to be specified, for both the landfast ice zone and the active ice zone, including different types of partial ice cover, full ice cover, and open water situations. An example run is presented for a circular vertical structure in the pack zone of the Canadian Beaufort Sea, considering scenarios involving first-year ridges, level ice, and multi-year floes in the full ice cover season. 2 figs., 5 tabs.

45883 (DNV/C–W62-11-88-6E) **Development of a model for progressive damage in ice.** Cormeau, A.; Jordan, I.J.; Maes, M. Det Norske Veritas (Canada) Ltd. (Canada). 1988. 127p. (MICROLOG–89-02042). Available from Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report addresses two important aspects of the interaction between ice and fixed structures: progressive damage to ice during compression, an the clearing of pulverized material around an indentor. Computer models were developed using finite element methods to emulate and analyze the behaviour of ice, including the viscous flow of crushed ice. Scarcity of relevant data on ice crushing led to a number of assumptions based on existing damage theories for metals, concrete and rocks. An isotropic shear degradation model was implemented and uniaxial loading tests were applied, showing strain softening effects. A shear damage model was successfully applied to the spread of microcracks during an ice sheet indentation test. An accurate prediction of the shape of the crushed layer was inhibited by the restrictions associated with the explicit time step algorithm. A relationship among velocity, viscosity, ice thickness and pressure on the indenter was derived. 60 refs., 34 figs., 2 tabs.

45884 (DNV/C–W62-11-88-11-1E) **Probabilistic framework for ice loads on fixed marine structures. Vol. 1, study description.** Nessim, M.; Cormeau, A. Det Norske Veritas (Canada) Ltd. (Canada). 1988. 175p. (MICROLOG–89-02022). Available from Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Probabilistic models have been developed for the estimation of global and local ice interactions with fixed marine structures in Canadian offshore waters. The models produce load descriptions which are compatible with probability-based design code requirements and can thus be used in selecting design criteria. Ice loading is estimated by using probabilistic environmental inputs in appropriate ice-structure interaction models to produce a probabilistic distribution of the load. This is then used in extremal models to calculate the probability distribution of the maximum annual load or pressure which is the basis for selecting design loads. The study included the statistical analysis of environmental data and ice mechanical properties in order to obtain the best probabilistic descriptors of input parameters to the model. Ice-structure interaction models were selected from available approaches and new models were developed for areal ice feature collisions in open water and winter conditions. The probabilistic models which were developed included stochastic process models for differenct ice load scenarios, models for the exposure levels of the structure to a given scenario and models for estimating the load magnitude during stationary continuous processes are also used. These components were included in integrated models and computer programs for calculating global loads and local pressures and techniques for dealing with short data records were also developed. 63 refs., 47 figs., 18 tabs.

45885 (IKU-R–32.0326.00/01/88) **Ionosphere influences on the navigation and positioning with the Navstar Global Positioning System (GPS).** Haarstad, I. Institutt for Kontinentalundersoekelser og Petroleumsteknologi A/S, Trondheim (Norway). Mar 1988. 92p. (In Norwegian). Order Number DE89914756/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

The report concerns a project dealing with the use of the Navstar-GPS (Global Positioning System) in the polar regions of Norway. The quality of data influenced by ionospheric disturbances in connection with the accuracy of navigation and positioning in the area are investigated. The various instruments and methods used in the investigation are presented.

45886 (NEI-DK–190) **Analysis of prototype freak waves.** Klinting, P.; Sand, S.E. Dansk Hydraulisk Inst., Hoersholm (Denmark). 1987. 15p. (CONF-8706402–1: ASCE special conference nearshore hydrodynamics, Jun 1987). Order Number DE89914662/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

EFP-86.

From continuous storm wave records taken in the North Sea freak wave envents have been isolated and analyzed. The analyses have been performed on several levels. First of all it has been investigated whether surface profiles and horizontal orbital velocities could be explained by 2-D (long crested) wave theories up to fifth order. Secondly, the phenomenon has been treated as a 3-D (directional) interaction case. Velocity vectors in three levels have been studied in order to reveal possible special 3-D characteristics. Also low and high-pass filters have been used as elements in the analysis of the composition of freak waves. From the limited amount of data analyzed so far the high frequency part of the freak waves seems to be strongly directional. In order to describe in detail the character of the high frequency waves a three-dimensional second-order (higher harmonic) separation technique was used to isolate bound- and free components. As a reference for future analysis of freak waves the wave climate producing the ones presented herein has also been analyzed in detail. Development with time of mean directions, directional spread and spectral density is presented. (author).

45887 (NEI-NO–90, pp. 8) **Mapping of central depressions.** Dekko, T. Norske Sivilingenioerers Forening, Oslo (Norway). 1986. (In Norwegian). (CONF-8601153–: Experiences with offshore instrumentation, 29-31 Jan 1986). In *Experiences with offshore instrumentation.* Order Number DE89902379/JAW. Available from NTIS (US Sales Only), PC A13/MF A01 - Norske sivilingenioerers forening, pb. 2312 Solli, 0201 Oslo 2.

The paper deals with the mapping of central sea bed depressions (pock marks) on the Norwegian continental shelf. The mapping is done in the western part of the Norwegian Trench for the selection of a pipeline route from the Oseberg field to the west coast of Norway. Examples from the surveyed depressions done with echosounders, deep towed boomers, side scan sonars, and ROV (Remote Operational Vehicles) are compared. 5 figures.

45888 (RF-SPS-A–44/85) **Working environment and safety in offshore drilling. Remote control/automation of drilling operations.** Mortensen, A. Rogalandsforskning, Stavanger (Norway). Oct 1985. 78p. (In Norwegian). Order Number DE89914786/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

The evaluation of methods to be used for the mechanization and automatization of dangerous drilling operations has been an actual theme for a period of five to ten years in Norway. The legislation in this field has enforced the development of mechanized equipment on the drilling floor for new types of drilling rigs. The experience gained from the use of integrated instrumentation and automation in similar projects are discussed. The use of such types of systems and also an advanced operator communication are fundamentals for the design of automatized drilling rigs in the future. Different methods of development for automated drill-pipe handling are considered. New concepts for a derrick are discussed. In the appendix, examples are given on the design of a control room for drillers and a process control and data acquisition system. 34 figs., 1 tab., 5 refs.

45889 Submersible purification system for radioactive water. Abbot, M.L.; Lewis, D.R. To Dept. of Energy, Washington, DC. USA Patent 4,828,691. 9 May 1989. Filed date 30 Nov 1987. vp. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

A portable, submersible water purification system for use in a pool of water containing radioactive contamination includes a prefilter for filtering particulates from the water. A resin bed is then provided for removal of remaining dissolved, particulate, organic, and colloidal impurities from the prefiltered water. A sterilizer then sterilizes the water. The prefilter and resin bed are suitably contained and are submerged in the pool. The sterilizer is water tight and located at the surface of the pool. The water is circulated from the pool through the prefilter, resin bed, and sterilizer by suitable pump or the like. In the preferred embodiment, the resin bed is contained within a tank which stands on the bottom of the pool and to which a base mounting the prefilter and pump is attached. An inlet for the pump is provided adjacent the bottom of the pool, while the sterilizer and outlet for the system is located adjacent the top of the pool.

45890 Introduction to the physics of particle accelerators. Edwards, D.A. (Fermi National Accelerator Lab., Batavia, IL (USA)); Syphers, M.J. pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The purpose of this course is to illustrate the application of the principles of physics in the field of particle accelerators. The emphasis is on the principles rather than the technology. The authors do not attempt to survey the entire field. Rather, they have selected topics that are consistent with their experience and that they think are interesting. Since they have primarily worked with synchrotrons, much of the discussion will relate to this variety of accelerator. The first half of the course deals with the motion of a single particle under the influence of electric and magnetic fields. The basic language of linear and circular accelerators is developed in this material. The principle of phase stability is introduced, and phase oscillations in linacs and synchrotrons are studied. Next, the by-now standard treatment of betatron oscillations is presented, followed by an excursion into nonlinear dynamics and its application to accelerators. A specialist in accelerator dynamics would likely use more sophisticated techniques than is used in much of this discussion. Though they do make use of the Hamiltonian formalism in some of the treatment of non-linear motion, they feel that a more elementary approach is better suited for an introduction to the subject. In the first half of the course the particles are assumed to interact neither with each other nor with their environment. During the second half of the course, these restrictions are removed, and much of the discussion relates to intensity-dependent effects - in particular, space charge, and coherent instabilities. 14 references.

45891 Description of particle accelerators using high-order perturbation theory on maps. Berz, M. (Univ. of Giessen (West Germany)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The perturbative description of particle accelerators using Taylor series maps is discussed. A new technique is presented which allows a very efficient computation of high order maps. It is shown how this method can be used to determine maps of the action of various electromagnetic fields including fringe fields, measured fields and space-charge fields. Once the map of the system is known, it can be used for several purposes. Firstly, it allows an exact, non-numerical calculation of quantities of interest like tune shifts and chromaticities. Secondly, it can be transformed into different coordinates in which the motion of the particles has a particularly simple form and which is helpful for the search of invariants and KAM surfaces. Finally the map can also be used for tracking, if desired also in combination with symplectification procedures. Here the major advantage of the map is the gain in speed compared to direct tracking. As with any tracking method, however, care should be exercised not to overestimate the results of such simulations, in particular for large numbers of iterations. 37 references, 6 figures.

45892 Methods of stability analysis in nonlinear mechanics. Warnock, R.L. (Stanford Univ., CA (USA)); Ruth, R.D.; Gabella, W.; Ecklund, K. pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). DOE Contract FG02-86ER40302. (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The authors review their recent work on methods to study stability in nonlinear mechanics, especially for the problems of particle accelerators, and compare their ideas to those of other authors. They emphasize methods that (a) show promise as practical design tools, (b) are effective when the nonlinearity is large, and (c) have a strong theoretical basis. 24 references, 2 figures, 2 tables.

45893 Review on the lattice design of large hadron colliders. Lee, S.Y. (Brookhaven National Lab., Upton, NY (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The conceptual evolution of the accelerator lattice design is discussed. Indicated are aspects of IR design. The cancellation of stop-band width in the cluster design is emphasized. The case of symmetric vs antisymmetric design is also discussed. The SSC lattice is used as an example. 9 references, 7 figures, 1 table.

45894 Physics of codes. Cooper, R.K. (Los Alamos National Lab., NM (USA)); Jones, M.E. pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The title given this paper is a bit presumptuous, since one can hardly expect to cover the physics incorporated into all the codes already written and currently being written. The authors focus on those codes which have been found to be particularly useful in the analysis and design of linacs. At that the authors will be a bit parochial and discuss primarily those codes used for the design of radio-frequency (rf) linacs, although the discussions of TRANSPORT and MARYLIE have little to do with the time structures of the beams being analyzed. The plan of this paper is first to describe rather simply the concepts of emittance and brightness, then to describe rather briefly each of the codes TRANSPORT, PARMTEQ, TBCI, MARYLIE, and ISIS, indicating what physics is and is not included

in each of them. It is expected that the vast majority of what is covered will apply equally well to protons and electrons (and other particles). This material is intended to be tutorial in nature and can in no way be expected to be exhaustive. 31 references, 4 figures.

45895 Canonical integrators as tracking codes (or how to integrate perturbation theory with tracking). Forest, E. (Lawrence Berkeley Lab., CA (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

This lecture is supposed to be about tracking codes. This lecture is actually about the ideal single-particle code for a large circular machine. This code must be able to track particles and produce high-order maps that can be analyzed by canonical perturbation theory. This lecture will set guidelines for critically judging the existing codes as well as the future codes that might be designed. 15 references.

45896 Science in the age of accelerators. Perl, M.L. (Stanford Linear Accelerator Center, CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). DOE Contract AC03-76SF00515. (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Accelerators have brought the particle physicists to work and live in three worlds: the private world of science, the public world of science, and the world of large accelerators. The private world is the apparatus, the data, the theories, the colleagues, the journals, the meetings, and above all the understanding of elementary particles. The public world of science is how society sees scientists and how scientist want to be seen in newspapers and on TV, how scientist interact with governments, and most important how governments support science. 7 references, 20 figures.

45897 Accelerator projects, worldwide. Teng, L.C. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

At any given time one always has the feeling that the funding for basic research is tight and inadequate. But an overall examination of the current accelerator projects in the world at all stages of proposal, construction, and operation proves to be rather reassuring. The result of this survey is presented here in tabulated form, and the rationale and utility of these projects are discussed and compared. Accelerator projects can be broadly classified in the following four categories: (1) High Energy Colliders - The pursuit of high energies or small dimensions for particle physics studies is the initial and basic motivation for the development of accelerators. The high energy frontier is now covered exclusively by colliders. (2) High Intensity, Medium Energy Accelerators - Machines of this category are useful for both particle and nuclear physics research. (3) Synchrotron Radiation Storage Rings - These machines have mushroomed during the past decade into a large and important category of accelerators. The synchrotron radiation from an electron beam travelling inside the dipole magnets or the undulators in a storage ring yields VUV and X-rays of unprecedented brilliance and brightness for studies of atoms, molecules, and condensed matters, and for industrial and medical applications. Most of these storage rings are in the energy range of 0.7 GeV to 7 GeV. (4) Low Energy Medical, Industrial and Research Accelerators - Large numbers of low energy accelerators of all types are used for atomic and nuclear research and for applications in industry and medicine. This paper describes principally projects of the first two categories. 1 figure, 5 tables.

45898 (SAND--89-7066) **Aurora second single arm tests.** Warren, T. Physics International Co., San Leandro, CA (USA). Mar 1989. 56p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (PIFR--4032). Order Number DE89015195/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Aurora Prompt Gamma Flash Simulator is a four module, 14-TW pulsed power machine that has been operated by Harry Diamond Laboratories (HDL) since it was commissioned in 1972. In response to new simulation needs, Aurora has been undergoing a series of machine upgrades aimed at providing a more flexible simulation environment. These upgrades have included developing multi-pulse and short-pulse capabilities, and improving machine reliability with new Marx generators. One outgrowth of the new machine capabilities is the requirement for improved synchronization of the four Blumlein modules. This improved synchronization has been the subject of a joint program between Physics International (PI) and Sandia National Laboratories in Albuquerque (SNLA) funded by Harry Diamond Laboratories. 9 refs., 19 figs., 7 tabs.

45899 (ANL--87-15) **7-GeV Advanced Photon Source Conceptual Design Report.** Argonne National Lab., IL (USA). Apr 1987. 515p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE89015624/JAW. Available from NTIS, PC A22/MF A01; OSTI; INIS; GPO Dep.

During the past decade, synchrotron radiation emitted by circulating electron beams has come into wide use as a powerful, versatile source of x-rays for probing the structure of matter and for studying various physical processes. Several synchrotron radiation facilities with different designs and characteristics are now in regular operation throughout the world, with recent additions in this country being the 0.8-GeV and 2.5-GeV rings of NSLS at Brookhaven National Laboratory. However, none of the operating facilities has been designed to use a low-emittance, high-energy stored beam, together with modern undulator devices, to produce a large number of hard x-ray beams of extremely high brilliance. This document is a proposal to the Department of Energy to construct and operate high-energy synchrotron radiation facility at Argonne National Laboratory. We have now chosen to set the design energy of this facility at 7.0 GeV, with the capability to operate at up to 7.5 GeV.

45900 (ANL--87-15-Annex) **Annex to 7-GeV Advanced Photon Source Conceptual Design Report.** Argonne National Lab., IL (USA). May 1988. 172p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. Order Number DE89015625/JAW. Available from NTIS, PC A08/MF A01; OSTI; INIS; GPO Dep.

The Annex to the 7-GeV Advanced Photon Source Conceptual Design Report updates the Conceptual Design Report of 1987 (CDR-87) to include the results of further optimization and changes of the design during the past year. The design changes can be summarized as affecting three areas: the accelerator system, conventional facilities, and experimental systems. Most of the changes in the accelerator system result from inclusion of a positron accumulator ring (PAR), which was added at the suggestion of the 1987 DOE Review Committee, to speed up the filling rate of the storage ring. The addition of the PAR necessitates many minor changes in the linac system, the injector synchrotron, and the low-energy beam transport lines. 63 figs., 18 tabs.

45901 (BNL--52205) **Phase 2 safety analysis report: National Synchrotron Light Source.** Stefan, P. (ed.). Brookhaven National Lab., Upton, NY (USA). Jun 1989. 131p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE89015179/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The Phase II program was established in order to provide additional space for experiments, and also staging and equipment storage areas. It also provides additional office space and new types of advanced instrumentation for users. This document will deal with the new safety issues resulting from this extensive expansion program, and should be used as a supplement to BNL Report No. 51584 "National Synchrotron Light Source Safety Analysis Report," July 1982 (hereafter referred to as the Phase I SAR). The initial NSLS facility is described in the Phase I SAR. It comprises two electron storage rings, an injection system common to both, experimental beam lines and equipment, and office and support areas, all of which are housed in a 74,000 sq. ft. building. The X-ray Ring

provides for 28 primary beam ports and the VUV Ring, 16. Each port is capable of division into 2 or 3 separate beam lines. All ports receive their synchrotron light from conventional bending magnet sources, the magnets being part of the storage ring lattice. 4 refs.

45902 Compendium of computer codes used in particle accelerator design and analysis. pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.). American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

In preparing this compilation, the authors came across the names of more than 150 programs that have been used in the design and analysis of accelerators. Many are obsolete and some are not easily transported from the institution where they were created. All are included in this compilation and filed at Los Alamos, but the obsolete codes have been removed from this article. Other than the judgment as to whether or not a particular code is obsolete, any critical evaluations have not been made. This document is organized so that each code is described on a one- or two-page data sheet. The data sheets are arranged alphabetically by code name but are not numbered. In this way, it will be easy to insert new codes as they are discovered. The code data sheets are preceded by three indexes: (1) subject, (2) person-to-contact, and (3) code acronym. It was not useful to list codes by authors because, in many cases, the original author is no longer associated with the code and many other persons have contributed to maintaining and improving the code.

45903 Final focus systems for linear colliders. Erickson, R.A. (Stanford Linear Accelerator Center, CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). DOE Contract AC03-76SF00515. (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The final focus system of a linear collider must perform two primary functions: it must focus the two opposing beams so that their transverse dimensions at the interaction point are small enough to yield acceptable luminosity, and it must steer the beams together to maintain collisions. In addition, the final focus system must transport the outgoing disrupted beams to a location where they can be recycled or safely dumped. As of this writing, the only full-scale collider final focusing system actually constructed is that of the SLAC Linear Collider, better known simply as the SLC. The SLC is not a true linear collider in the sense of having two linacs pointed at each other. Instead, a single linac is used to accelerate bunches of positrons and electrons simultaneously to the desired energy. The bunches are then separated and guided around two arcs of alternating-gradient bending magnets to opposite ends of the final focus system. At the time of this writing, the construction of the SLC has been essentially completed, and initial commissioning tests are in progress. While most of the examples in this paper are drawn from the SLC, the principles and conclusions are generally applicable to other linear collider designs as well. 26 references, 17 figures, 1 table.

45904 Application of pulse power technology to ultra high energy electron accelerators. Nation, J.A. (Cornell Univ., Ithaca, NY (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The author presents in this paper a review of the application of pulse power technology to the development of high gradient electron accelerators. The technology demands are relatively modest compared to the ultra high power technology used for inertial confinement fusion drivers. With the advent of magnetic switching intense electron beams can be generated with a sufficiently high repetition rate to be of interest for high energy electron accelerator driver applications. Most of the techniques considered rely on the excitation of large amplitude waves on the beams. Within this framework there are two broad categories of accelerator, those in which the waves are directly excited in and supported by the medium and, secondly, those where the waves are used to generate radiofrequency signals which are then coupled via structures to the beam being accelerated. In what follows we shall consider both approaches. Present-day pulse power technology limits pulse durations to about 100 nsec. Consequently, if these sources are to be used, we will need to use high group velocity structures to avoid the need for short accelerator module lengths. An advantage of the short pulse duration is that the available acceleration voltage gradient increases compared to that obtained using conventional rf drivers. 19 references, 9 figures, 1 table.

45905 Plasma acceleration of particle beams. Katsouleas, T. (Univ. of California, Los Angeles (USA)); Dawson, J.M. pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Plasmas, being fully ionized gases, are immune from electrical breakdown and so can support ultra-high accelerating fields (order GeV/cm) in the form of relativistic plasma waves. Several schemes to excite these waves and use them for particle acceleration are reviewed in this article. These include the beat wave accelerator (laser driven) and the plasma wavefield transformer (particle beam driven). In addition, the possible use of plasmas to provide strong final focusing of beams (the plasma lens) is described. 39 references, 21 figures.

45906 Introduction. Edwards, D.A. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The Tevatron project included the construction of three new synchrotrons, but common usage has attached that name to the superconducting ring. In the mid 70's the growing appreciation of the potential of hadron colliders added an additional function to the requirements for the superconducting ring. It should act as a storage ring as well. The main special design features of the superconducting accelerator are the magnets themselves and the cryogenics to cool them. But other systems are also required such as magnet power systems and vacuum systems. The Tevatron was commissioned in 1983. Over four years after its commissioning, the Tevatron is still very much a prototype accelerator, as much a research instrument in its own right as it is a high energy physics tool.

45907 Emittance through the Fermilab accelerator chain. Finley, D. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

In this chapter the development of the proton beam emittance through the Fermilab accelerator chain from the 750-keV preaccelerator to the Tevatron is discussed. The basic relationships used to describe emittances are contained in Appendix A of Teng's paper in this volume, and the student may wish to refer to it at this time. The measurements given here were taken during late 1984 and early 1986. They indicated where there were some sources of emittance increase. Since that time, some improvements have been made and others are planned. 9 figures, 2 tables.

45908 Longitudinal phase space in circular accelerators. Martin, P.S. (Fermi National Accelerator Laboratory, Batavia, IL (USA)); Ohnuma, S. pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Here the author presents the formulae used to calculate bunch and bucket parameters for beams in circular accelerators. Then using these formulae, he analyzes one of the rf manipulations used for the Tevatron I collider operation and proposed for use in the SSC injector. 4 references, 17 figures, 3 tables.

45909 Longitudinal instabilities and stability criteria. Ng, K. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

First the author discusses the criteria necessary for longitudinal microwave instability. The second section estimates the limits of $Z_{\parallel}$ impedance, for the Main Ring in order to ensure longitudinal instability during its different performances. Section three addresses the estimates for impedance of the Main Ring at both low and high frequencies. Section four and five discuss experiments to measure impedance. 16 references, 21 figures, 8 tables.

45910 Beam loss. VanGinneken, A. (Fermi National Accelerator Lab., Batavia, IL (USA)); Edwards, D.; Harrison, M. pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

A basic problem in the operation of a superconducting accelerator is that of beam loss. Appreciable levels of energy deposition in the superconducting magnet coils result from relatively small fractions of the total circulating beam impinging on the magnets. This energy can heat the superconducting coil above transition temperature, causing it to go normal and the element to quench. The results deposition of internally stored magnetic energy causes a rapid temperature rise. Recovery from a magnet quench varies from about 20 minutes to several hours and is thus very disruptive to the accelerator operation. In the initial stages of the Tevatron project concerns arose regarding the ability of the superconducting magnets to function in an operational environment where significant beam losses are present. Energy deposition experiments were performed in the Fermilab external beam areas, which then provided the impetus for developing the necessary computer codes. This paper describes the accelerator geometry. The rest of the paper discusses a detailed attempt to simulate a fast extraction cycle, essentially in chronological order. These interact either elastically or inelastically with the septum wires, and the products of these interactions are traced through the machine. Where these particles leave the accelerator, energy deposition levels in the magnets are calculated together with the projected response of the beam-loss monitors in this region. Finally, results of the calculation are compared with experimental data. 16 references, 26 figures, 2 tables.

45911 Induction accelerators and free-electron lasers at LLNL. Briggs, R.J. (Lawrence Livermore National Lab., CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). DOE Contract W-7405-ENG-48. (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Linear induction accelerators have been developed to produce pulses of charged particles at voltages exceeding the capabilities of single-stage, diode-type accelerators and at currents too high for rf accelerators. In principle, one can accelerate charged particles to arbitrarily high voltages using a multi-stage induction machine. The advent of magnetic pulse power systems makes sustained operation at high repetition rates practical, and high-average-power capability is very likely to open up many new applications of induction machines. In part A of this paper, the US induction linac technology is surveyed emphasizing electron machines. A simplified description is given of how induction machines couple energy to the electron beam to illustrate many general issues that designers of high-brightness and high-average-power induction linacs must consider. An example is given of the application of induction accelerator technology to the relativistic klystron, a power source for high-gradient accelerators. In part B the application of LIAs to free-electron lasers is addressed. The multikiloampere peak currents available from linear induction accelerators make high-gain, free-electron laser amplifier configurations feasible. High extraction efficiencies in a single pass of the electron beam are possible if the wiggler parameters are appropriately tapered, as recently demonstrated at millimeter wavelengths on the 4-MeV ELF facility. Key issues involved in extending the technology to shorter wavelengths and higher average powers are described. Current FEL experiments at LLNL are discussed. 5 references, 16 figures, 1 table.

45912 Particle accelerators and discoveries in elementary particle physics. Jones, L.W. (Univ. of Michigan, Ann Arbor (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Some discoveries in elementary particle physics are recounted from personal and historical perspective with particular reference to their interaction with particle accelerators. The particular examples chosen include the ψ/J, the Y, and the study of nucleon constituents with inelastic electron scattering. Precursor experiments are cited together with the better known discoveries. 27 references, 9 figures, 1 table.

45913 (IN2-P3--89-01, pp. 213-254) **TeV linear e+e- colliders.** Le Duff, J. (Paris-11 Univ., 91 - Orsay (FR). Lab. de l'Accelerateur Lineaire). Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France). 1989. (In French). (CONF-8709294--: 19. Ecole de Physique des Particules (Gif-sur-Yvette summer school of Particle Physics), 7-11 Sep 1987). In *Strings and superstrings. Electron linear colliders.* Order Number DE89903207/JAW. Available from NTIS (US Sales Only), PC A13/MF A01.

The limits of circular e^+e^- colliders and the principles of linear colliders are presented. Constraints linked to performance: luminosity and beam-beam Bremsstrahlung are indicated. Technical constraints are reviewed: accelerating structures, output, and efficiency; HF breakdown; superconducting structures; HF power sources (klystrons, lasertrons); electron guns; and storage rings.

45914 (IN2-P3--89-01, pp. 255-283) **Recent progress at the Stanford linear collider.** Bambade, P.S. (Stanford linear accelerator center, Menlo Park, CA (US)). Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France). 1989. (CONF-8709294--: 19. Ecole de Physique des Particules (Gif-sur-Yvette summer school of Particle Physics), 7-11 Sep 1987). In *Strings and superstrings. Electron linear colliders.* Order Number DE89903207/JAW. Available from NTIS (US Sales Only), PC A13/MF A01.

Commissioning of the Stanford linear collider is proceeding towards an initial low luminosity physics run. Both beams are routinely extracted onto their dumps, and reasonably small beam sizes are produced at the IP. Main priorities are phase-space controls and stability in the whole machine needed to maintain small spots, background reductions, and general system reliability. Studies indicate that collimators may have to be redeployed in the final focus to upstream places where beams can be comfortably trimmed without generating excessive muons in the detector. Enhanced optical matching in the arcs through harmonic corrections is being considered to help reduce distortions in the final focus. It is hoped to produce and detect a hundred Z^0.

45915 (KEK--88-10, pp. 330-339) **Research and development for the Japanese linear collider JLC.** Takata, Koji (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324--: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

Conceptual design work was started in 1984 for a 1 TeV linear collider in Japan and since then, R and D activities have been continued to extend the technology. In the present report, the results are summarized and prospects for the coming two to three years are given. The present plan for continuing the lasertron experiment is to try large voltages beyond 150kV to confirm the principle of operation and also to develop strong photocathodes made of, for example, Cs_3Sb or Cs_3Sb-K. The debunching effect would be far severer when the frequency is raised four times the present one to the design value 11.4 GHz. The lasertron thus needs much R and

D before it becomes of practical use as a high power microwave source. But the photocathode technology developed so far would be applied for a high current electron source of an extremely low emittance and also polarized electron source. The second subject has been to try to excite in accelerating structure a high gradient field on the order of 100 MV/m which is far beyond the level attained for linear accelerators in Japan. While all experiments of this kind outside Japan have been aimed at exciting a standing wave mode in a structure, the aim of the present project is to excite a travelling wave mode which is employed in actual linear accelerators. (N.K.).

45916 (LBL–27496) **A history of central collisions at the Bevalac.** Poskanzer, A.M. Lawrence Berkeley Lab., CA (USA). Jul 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8905143–10: NATO international advanced courses on the nuclear equation of state, 12 May - 3 jun 1989). Order Number DE89016046/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

You have heard a great deal about Plastic Ball results at this conference. There were talks on the first morning by Hans-Georg Ritter and Karl-Heinz Kampert on the Plastic Ball at Berkeley, there will be a talk next week by Rudi Schmidt on the Plastic Ball at CERN, and many other speakers have mentioned Plastic Ball results. The young students may think that when the new field of relativistic heavy ion physics opened up, an ideal detector was designed and built, data immediately analyzed, and results produced. The theme of my talk is to show that this is incorrect. The experiments proceeded in logical stages, one building upon the other, increasing in complexity and sophistication. The analysis techniques and the theory developed along with the experiments. If the more senior people in the audience easily remember this history of the development of the relativistic heavy ion field, they may spend their time during this talk thinking about what is happening now and what will happen in the future in the ultrarelativistic heavy ion field, where I believe history is repeating itself. 18 refs., 18 figs.

45917 (SLAC-PUB–5024) **Alignment and vibration issues in TeV linear collider design.** Fischer, G.E. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890803–4: International conference on high energy accelerators, 20-26 Aug 1989). Order Number DE89015631/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The next generation of linear colliders will require alignment accuracies and stabilities of component placement at least one, perhaps two, orders of magnitude better than can be achieved by the conventional methods and procedures in practice today. The magnitudes of these component-placement tolerances for current designs of various linear collider subsystems are tabulated. In the micron range, long-term ground motion is sufficiently rapid that on-line reference and mechanical correction systems are called for. Some recent experiences with the upgraded SLAC laser alignment systems and examples of some conceivable solutions for the future are described. The so called "girder" problem is discussed in the light of ambient and vibratory disturbances. The importance of the quality of the underlying geology is stressed. The necessity and limitations of public-beam-derived placement information are mentioned. 40 refs., 4 figs., 1 tab.

45918 (ANL-HEP-CP–89-75) **Experimental studies of plasma wake-field acceleration and focusing.** Rosenzweig, J.B.; Cole, B.; Ho, C.; Gai, W.; Konecny, R.; Mtingwa, S.; Norem, J.; Rosing, M.; Schoessow, P.; Simpson, J. Argonne National Lab., IL (USA). High Energy Physics Div. 18 Jul 1989. 49p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. (CONF-8905156–2: International Centre for Theoretical Physics conference, 22-26 May 1989). Order Number DE89016718/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

More than four years after the initial proposal of the Plasma Wake-field Accelerator (PWFA), it continues to be the object of much investigation, due to the promise of the ultra-high accelerating gradients that can exist in relativistic plasma waves driven in the wake of charged particle beams. These large amplitude plasma wake-fields are of interest in the laboratory, both for the wealth of basic nonlinear plasma wave phenomena which can be studied, as well as for the applications of acceleration of focusing of electrons and positrons in future linear colliders. Plasma wake-field waves are also of importance in nature, due to their possible role in direct cosmic ray acceleration. The purpose of the present work is to review the recent experimental advances made in PWFA research at Argonne National Laboratory, in which many interesting beam and plasma phenomena have been observed. Emphasis is given to discussion of the nonlinear aspects of the PWFA beam-plasma interaction. 29 refs., 13 figs.

45919 **Transverse motion of single particles in accelerators.** Talman, R. (Cornell Univ., Ithaca, NY (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Any accelerator must have focusing elements, usually magnetic quadrupoles, which hold individual particles close to an ideal central orbit. The purpose of this chapter is to analyze the transverse motion of particles and beams in such systems, with particular emphasis on circular machines. A particle not precisely on the central orbit is subject to a restoring force tending to reduce the deviation and, as a result, the particle oscillates around the central orbit. These oscillations are usually called betatron oscillations when they occur in a circular machine, and the same terminology will be used even for motion in any beam transport system. There is a well established formalism for the mathematical description of betatron motion. For want of a better name and following Collins this could be called Beta Theory, since the main function appearing in the theory is $\beta(s)$, where s is a longitudinal coordinate measuring arc length along the central orbit. 10 references, 11 figures.

45920 **Fundamentals - longitudinal motion.** Weng, W.T. (Brookhaven National Lab., Upton, NY (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

There are many ways to accelerate charged particles to high energy for physics research. Each has served its purpose but eventually has encountered fundamental limitations of one kind or another. Looking at the famous Livingston curve, the initial birth and final level-off of all types of accelerators is seen. In fact, in the mid-80s we personally witnessed the creation of a new type of collider - the Stanford Linear Collider. Also witnessed, was the resurgence of study into novel methods of acceleration. This paper will cover acceleration and longitudinal motion in a synchrotron. A synchrotron is a circular accelerator with the following three characteristics: (1) Magnetic guiding (dipole) and confinement (quadrupole) components are placed in a small neighborhood around the equilibrium orbit. (2) Particles are kept in resonance with the radio-frequency electric field indefinitely to achieve acceleration to higher energies. (3) Magnetic fields are varied adiabatically with the energy of the particle. D. Edwards described the transverse oscillations of particles in a synchrotron. Here the author talks about the longitudinal oscillations of particles. The phase stability principle was invented by V. Veksler and E. McMillan independently in 1945. The phase stability and strong focusing principle, invented by Courant and Livingston in 1952, enabled the steady energy gain of accelerators and storage rings witnessed during the past 30 years. This paper is a unified overview of the related rf subjects in an accelerator and a close coupling between accelerator physics and engineering practices, which is essential for the major progress in areas such as high intensity synchrotrons, a multistage accelerator complex, and anti-proton production and cooling, made possible in the past 20 years.

45921 Beam observation and the nature of instabilities. Gareyte, J. (CERN, Geneva (Switzerland)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The point of view presented in this paper will be that of an experimental accelerator physicist who had to struggle for many years with all sorts of collective beam instabilities occurring in different accelerators and storage rings and this, most often, with great enjoyment. Detailed and rigorous mathematical descriptions, as well as quantitative formulae to evaluate thresholds and growth rates will be found elsewhere. Here the author will dwell on the various means which have been invented to observe the beams, to track and record their most intimate behavior in order to assess their margin of stability, and finally through a better understanding of their properties to devise ways of increasing the machine performance. Although in this exercise good theories are a necessary ingredient, more emphasis will be put on the almost intuitive understanding of the nature of the fundamental phenomena at work. The first chapter will describe the observable manifestations of an ensemble of particles with no interactions between them. The second and third chapters will study the effect of wake fields on the collective behavior of the beam particles. The basic nature of beam instabilities will be shown with the help of simple examples. 49 references, 39 figures.

45922 Introduction to wakefields and wake potentials. Wilson, P.B. (Stanford Linear Accelerator Center, CA (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). DOE Contract AC03-76SF00515. (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

What are wakefields and wake potentials, and why are these concepts useful in the physics of linear accelerators and storage rings? This question is approached by first reviewing the basic physical concepts which underlie the mathematical formalism. Then a summary is presented of the various techniques that have been developed to make detailed calculations of wake potentials. Finally, some applications are given to current problems of interest in accelerator physics. No attempt at completeness can be made in an introductory article of modest length. Rather a broad overview is given and key references for more detailed study are listed. It will also be apparent that the last chapter on this subject, with all the loose end neatly tied up, has yet to be written. There are subtle points, there are controversial questions, and active calculations to resolve these questions are continuing at the time of this writing. 61 references, 10 figures, 1 table.

45923 Quantum treatment of beamstrahlung and its application to ribbon pulses. Blankenbecler, R. (Stanford Linear Accelerator Center, CA (USA)); Drell, S.D. pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

In Part I a straightforward high energy expansion is discussed and applied to the problem of radiation from an extended target. In particular, bremsstrahlung from an electron-pulse collision is discussed. A full quantum treatment of the power spectrum and the average energy loss is given. Scaling laws that smoothly join the quantum regime to the classical limit are derived. In Part II the high energy expansion introduced in Part I is used to describe the problem of beamstrahlung due to an extended pulse with an elliptical cross section of arbitrary eccentricity. It is shown that the transverse geometry of the pulse enters in a remarkably simple scaling manner. This case is of interest because the radiative energy loss can be markedly reduced while simultaneously keeping a fixed luminosity if the beam pulses are very thin in one transverse direction, i.e. shaped like ribbons. Effects of other types of beam shaping are briefly discussed, and the physics of the process is emphasized. 30 references, 3 figures, 2 tables.

45924 Methods of beam optics. Willeke, F. (Deutsches Elektronen-Synchrotron, Hamburg (West Germany)); Ripken, G. pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

In the following report a survey of linear machine theory is given. The investigations are restricted to coasting-beam betatron motion but coupling is taken into account in a general way. The equations of motion for on- and off-momentum particles are derived and written in canonical form. From the canonicity it follows that all transfer matrices are automatically symplectic. Eigenvector methods are introduced to study the stability behavior. To investigate the influence of coupling, generalized lattice functions are defined and canonical perturbation techniques are applied. 13 references, 10 figures.

45925 Nonlinear dynamics. Guignard, G. (CERN, Geneva (Switzerland)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Following an introduction on analytical mechanics, canonical transformations, and perturbation theory, a description is given of nonlinear effects for near-integrable systems associated with resonances, amplitude variations with multiple crossings, adiabatic changes of the parameters, and time variation of the perturbation. Examples of applications coming from observations and calculations related to CERN accelerators concern coupling measurements, intra-beam scattering, beam-beam effects, magnetic imperfections, two-beam overlap knock-out, and synchro-betatron resonances. Finally, the notion of invariant distortion and aperture of bounded motion in the presence of multipoles are introduced. 20 references, 12 figures, 7 tables.

45926 Phase space concepts. Michelotti, L. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

By 1892, Henri Poincare already had published his landmark work in which he advanced the theses that differential equations should be viewed as geometric objects, in particular, as vector fields on manifolds, and that questions concerning the long-term stability of a dynamical system might be attacked by studying the topological properties of these objects. His work even led him to recognize the extraordinarily complicated behavior of orbits in the vicinity of a separatrix, what today they would call chaos. In these lectures the author looks into this geometric approach to the study of Hamiltonian dynamical systems, especially in connection with the kinds of problems which arises in accelerator orbit theory. The modest goals here will be to delineate the idea of invariant tori in phase space, to define and illustrate the importance of resonant orbits and their separatrices as structures for organizing dynamics, and to touch upon the meaning of chaotic orbits in nonintegrable systems. Further, the author hopes to lessen the impression which some may have acquired during their formal education that classical mechanics is a dull, closed subject with no mysteries left to explore. 26 references, 15 figures.

45927 Comments on nonlinear dynamics studies in storage rings. Chao, A.W. (Lawrence Berkeley Lab., CA (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

If the storage ring optics is perfectly linear, the trajectory of a particle, as observed at a fixed location in the storage ring, traces out a circle in the normalized phase space (q,p). The tune v (phase advance per turn/2π) is independent of the initial coordinates of the particle. It is assumed that v is an irrational number. The picture becomes complicated when a nonlinear perturbation is added to the system. The first complication is the introduction of tune shift. For

particles near the phase-space origin, the tune remains v, but as the particle amplitude A increases, the tune shifts. As the tune changes, it can no longer stay irrational. Around each discrete dot corresponding to a rational tune, an island of finite area is created, and immediately outside the islands is a thin chaotic layer in which the turn-by-turn trajectory does not follow a smooth pattern. As the islands acquire finite sizes, they break the neighboring circles. The islands and chaotic layers emerge spontaneously in the entire phase space, even close to the origin. This means islands near the origin are extremely thin, and most invariant surfaces are able to maintain their existence and suffer only from a small distortion from a circle. The distorted circles constitute invariant surfaces. The percentage distortion from circles is called the smear. As the amplitude increases, the islands grow in size, breaking more invariant surfaces. As amplitude increases further, even the persistent invariant surfaces are broken by neighboring island chains which are now large enough to overlap. The islands still exist, but they now become disjoint, and they are embedded in a chaotic ocean. Particle motion is no longer bounded and instability occurs. The last invariant surface is called the dynamic aperture. 27 references, 7 figures.

45928 **Primer on beam dynamics in synchrotrons.** Teng, L. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

First, the author discusses the factors controlling the beam dynamics when the beam intensity, hence the self-field generated by the beam, is negligible. In this case the motions of the particles in the beam are independent and they have the so-called single-particle dynamics. The single-particle dynamics is clearly controlled only by external electromagnetic fields and external physical barriers such as beam collimators and vacuum chamber walls. The transverse motion is controlled principally by the magnetic field, and the longitudinal motion is controlled by the radiofrequency electric field. Next he discusses intensity-dependent dynamics. 1 table.

45929 **Detection and compensation of transverse resonances.** Gerig, R. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

This chapter discusses the operational implications of the problem of nonlinear dynamics in synchrotrons. Although accelerator designers try to avoid these problems in the design of their machines it is impossible to avoid the problems completely, and as a result it is important to be able to diagnose and provide compensation for the resulting transverse resonances. The author draws from his experience in working with the original 400-GeV Fermilab Main Ring, where these effects have been routinely observed at the injection energy of 8 GeV. The article first presents the problem and how it relates to machine performance. Techniques for measuring and compensating the resonance lines are then discussed, and the design of the correction system used to provide compensation is described. The last section discusses efforts to simulate the measurement and compensation process using a tracking program. 6 references, 5 figures, 2 tables.

45930 (DOE/ER/10666–1) **Analysis of coaxial wire measurement of longitudinal coupling impedance.** Gluckstern, R.L.; Li, R. Maryland Univ., College Park, MD (USA). Dept. of Physics. 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AS05-80ER10666. (CONF-890803–7: International conference on high energy accelerators, 20-26 Aug 1989). Order Number DE89015748/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In recent work, a method has been developed to calculate the longitudinal impedance for an azimuthally symmetric obstacle in a beam pipe of circular cross section. The method has been applied to a small obstacle, to an obstacle of general shape at high frequency, and to several obstacles, including a periodic structure at high frequency. Coupling impedances are difficult to measure directly. Instead, the reflection and transmission coefficients for a pulse carried through the obstacle on a thin coaxial wire are measured and the results approximate the longitudinal coupling impedance. In the present paper, an analysis is carried out including the coaxial wire and new boundary conditions for the fields at the surface of the wire. We then estimate the validity of the coaxial wire measurement for a variety of frequencies and geometries. Finally, several numerical calculations are carried out for both the beam and the wire pulse. The results confirm the predictions of the analysis. 7 refs., 3 figs.

45931 (FNAL-TM–1608) **Improved bunch spreader modules.** Ieiri, Takao. Fermi National Accelerator Lab., Batavia, IL (USA). 20 Jul 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE89015588/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In order to raise the threshold beam current of instabilities in the fixed target run, it is required to increase the longitudinal emittance, and hence the bunch length. The bunch spreader used a noise generator through a sharp-cut ban pass filter (BPF) instead of a coherent signal. In that filter, the pass band frequency was near twice the synchrotron frequency $2f_s$. The bandwidth of the filter was fixed between 350Hz and 600Hz, though twice the synchrotron frequency changed from 500Hz to 300Hz after transition in Main Ring. The noise through the filter is applied to an RF amplitude modulator. In the Tevatron, where the synchrotron frequency f_s varies from 120Hz to 40Hz during acceleration, the noise is applied to a phase shifter at the frequency of f_s. So, we need a tunable filter which tracks $2f_s$ in the Main Ring and f_s in the Tevatron. This note describes details of improved bunch spreader modules using a tunable filter used in both the Main Ring and the Tevatron. A brief description about this module along with a beam test done in the Main Ring is shown. 3 refs., 6 figs.

45932 (GSI–89-09) **KOBRA 3 - a code for the calculation of space-charge-influenced trajectories in 3-dimensions.** Spaedtke, P.; Wipf, S. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.). Jun 1989. 81p. Order Number DE89915121/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

KOBRA3 is a three-dimensional multi-purpose program, written in standard FORTRAN77. The main purpose of the program is to calculate the trajectories of charged particles through a static electro-magnetic field in three dimensions. If space charge is not negligible its influence is taken into account by an iterative process. The Laplace equation is solved for the scalar potential. During the ray tracing, in which the equations of motion for charged particles are solved, the space charge term in the Poisson equation is distributed onto the mesh. By repeating this procedure the steady-state Vlasov equation is solved: $\text{nabla}^2\text{phi} + \int\int\int f_p dxdydz = 0$, where phi is the electro-static potential and f_p(r vector, v vector) describes the distribution of the charged particles in space. KOBRA3 can handle finite plasma boundaries, which are found by the program automatically. Special features are included within the program to investigate the beam quality (emittance, transverse energy), and to display the geometry, the trajectories and the potential and magnetic fields graphically. The modular structure of the program enables the user to create his (her) own diagnostic programs or interfaces to the main program. This report is intended to facilitate the use of KOBRA3 by describing the theory, structure and numerical methods used. At GSI (Gesellschaft fuer Schwerionenforschung) the program runs on an IBM 3090-40E. The program has been installed on other machines e.g. CRAY XM-P, CRAY II, VAX 8600, IBM 3090-200, IBM 3033, ATARI ST, IBM-AT. (orig./HSI).

45933 (LA-UR–89-2795) **A solution to nonlinearity problems.** Neuffer, D.V. Los Alamos National Lab., NM (USA). 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-890803–5: International conference on high energy accelerators, 20-26 Aug 1989). Order Number DE89016975/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

New methods of correcting dynamic nonlinearities resulting from the multipole content of a synchrotron or transport line are presented. In a simplest form, correction elements are places at the

center (C) of the accelerator half-cells as well as near the focusing (F) and defocusing (D) quadrupoles. In a first approximation, the corrector strengths follow Simpson's Rule, forming an accurate quasi-local canceling approximation to the nonlinearity. The F, C, and D correctors may also be used to obtain precise control of the horizontal, coupled, and vertical motion. Correction by three or more orders of magnitude can be obtained, and simple solutions to a fundamental problem in beam transport have been obtained. 13 refs., 1 fig., 1 tab.

45934 (ORNL/FTR–2990) **[International conference on the physics of electronic and atomic collisions]: Foreign trip report, June 28, 1988–July 29, 1988.** Datz, S. Oak Ridge National Lab., TN (USA). 17 Aug 1988. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017279/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler participated in the Executive Committee and Program Committee meetings of the International Conference on the Physics of Electronic and Atomic Collisions (ICPEAC), held in Paris, France, June 30–July 2, 1988. There he acted as chairman of the task group on long-range planning for ICPEAC, and presented a report on future directions for the conference. He visited the Max Planck Institute for Nuclear Physics in Heidelberg, West Germany, July 5–7, 1988, where discussions were held on possibilities of transferring their cooling technology to Oak Ridge National Laboratory (ORNL) for the forthcoming HISTRDAP project and AIRM Electron Beam Target for the Holifield Heavy Ion Research Facility. The traveler visited the Physics Institute at the University of Giessen, Giessen, West Germany, where discussions were carried out on recent experiments in heavy-ion collision physics, and, in particular, to discuss possible ORNL experiments on electron pair ejection following dielectronic recombination. The traveler then visited the University of Aarhus, Aarhus, Denmark, where a collaborative experiment was performed using their newly operative merged beam electron target (MBET) to study dielectronic recombination in high resolution.

45935 (SLAC-PUB–4920) **An automated focal point positioning and emittance measurement procedure for the interaction point of the SLC.** Phinney, N.; Bambade, P.; Kozanecki, W.; Koska, W. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890335–250: 13. particle accelerator conference, 20-23 Mar 1989). Order Number DE89015629/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

To achieve maximum luminosity at the SLC, both the electron and positron beams must reach their minimum transverse size within 1 mm of the longitudinal location where the two bunches collide. This paper describes an automated procedure for positioning the focal point of each beam at this collision plant. The technique is based on measurements of the beam size utilizing either secondary emission or bremsstrahlung signals from carbon fibers a few microns in diameter. We have achieved simultaneous and reproducible measurements of the angular speed (~200 μrad) and the optimum beam spot size (~2 μm), which when combined yield measurements of the beam emittance consistent with those obtained using conventional profile monitor techniques. 8 refs., 5 figs., 1 tab.

45936 (SLAC-PUB–5049) **The high-gradient S-band linac for initial acceleration of the SLC [SLAC linear collider] intense positron bunch.** Clendenin, J.E.; Ecklund, S.D.; Hoag, H.A. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890803–2: International conference on high energy accelerators, 20-26 Aug 1989). Order Number DE89015637/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Although short lengths of S-band standing-wave, disk-loaded waveguide have been successfully RF-processed to accelerating gradients equivalent to about 175 MeV/m in a traveling-wave structure, the 20 MeV/m gradient of the SLC 50 GeV linac has been the highest gradient S-band accelerator in operation. However, the 1.5 m traveling-wave constant impedance capture section for the SLC positron source, operating with a dedicated 60 MW klystron, is now routinely accelerating single-bunch beams of more than 7×10^{10} e^+/pulse at rates of up to 60 Hz with an accelerating gradient section are described. 11 refs., 1 fig. 1 tab.

45937 **Methods of stability analysis in nonlinear mechanics.** Warnock, R. L. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309(US)); Ruth, R. D.; Gabella, W.; Ecklund, K. *AIP Conference Proceedings (American Institute of Physics) Conference Proceedings (USA)*, 184(1): 995-1014 (1 Apr 1989). DOE Contract AC03-76SF00515;FG02-86ER40302. (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, 20 Jul - 14 aug 1987).

We review our recent work on methods to study stability in nonlinear mechanics, especially for the problems of particle accelerators, and compare our ideas to those of other authors. We emphasize methods that (*a*) shows promise as practical design tools, (*b*) are effective when the nonlinearity is large, and (*c*) have a strong theoretical basis.

45938 (BONN-IR–88-60) **Polarized target physics at the Bonn electron accelerators.** Meyer, W. Bonn Univ. (Germany, F.R.). Physikalisches Inst.; Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet. Dec 1988. 93p. Order Number DE89915123/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

At the BONN 2.5 GeV electron synchrotron experiments with polarized nucleon targets have a long tradition. Starting with measurements of the target asymmetry in single pion photoproduction off polarized protons, resp. neutrons, the experiments have been concentrated on photodisintegration measurements of polarized deuterons. Parallel to these activities a considerable progress in the field of the target technology, e.g. cryogenics and target materials, has been made, by which all the measurements have profitted enormously. Especially the development of the new target material ammonia has allowed the first use of a polarized deuteron (ND_3) target in an intense electron beam. The construction of a frozen spin target, which will be used in combination with a tagged polarized photon beam, makes a new generation of polarized target experiments in photon induced reactions possible. Together with electron scattering off polarized deuterons and neutrons they will be a main activity in the physics program at the new stretcher accelerator ELSA in BONN. (orig.).

45939 **RF system considerations for a large hadron collider.** Raka, E. (Brookhaven National Lab., Upton, NY (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The radio-frequency (rf) system of a large hadron collider is required to operate in three different modes. It must capture and accumulate in stationary buckets (closed trajectories in longitudinal phase space) successive groups of bunches from its injector; accelerate these bunches in moving buckets up to the design energy; and finally store them, for several hours, while maintaining a minimum ratio of bunch-to-bucket area. In the storage mode it provides the nominal energy gain per turn required to make up for synchrotron radiation losses and for the power loss due to voltages induced in the impedances presented to the beam by the vacuum chamber and accelerating structures. Each of these modes requires its own set of rf system parameters, i.e. frequency, total gap voltage, power, etc. For conventional machines such as the NAL main ring or the CERN SPS the voltage and power requirements were determined by the acceleration mode since beam storage was not considered in their design. The choice of frequency 53-MHz standing-wave cavities at NAL and 200-MHz traveling-wave structure at CERN was based primarily on rf engineering considerations. For a large hadron collider the storage mode requirements can be the determining factors in the choice of peak voltage and frequency. This paper discusses how to arrive at a particular choice of voltage

and frequency; the type of acceleration structure that would be suitable for obtaining the required voltage and resonant impedance; static beam loading including a simplified beam stability criterion involving the beam current and total rf system shunt impedance; the basic principle of rf phase and frequency control loops; and the effect of rf noise and its interaction with these loops. Finally, the need for and design of RF systems to damp independently coherent oscillations of individual bunches or groups of bunches is considered. 30 references, 18 figures, 2 tables.

45940 Characteristics of synchrotron radiation. Kim, K. (Lawrence Berkeley Lab., CA (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). DOE Contract AC03-76SF00098. (CONF-8808234--Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Synchrotron radiation - the radiation produced by a charged particle moving with relativistic speed in curves trajectories - is playing an increasingly important role in many areas of basic and applied sciences. It provides intense, laser-like flux of photons in a wide range of spectral regions not accessible with other sources. In this paper, the principle of various synchrotron radiation sources and their characteristics are reviewed. There are three kinds of synchrotron radiation sources, bending magnets, wigglers, and undulators. In bending magnets, electrons move in a circular trajectory, producing a smooth spectrum. Wigglers can be regarded as a sequence of bending magnets of alternate polarities. Thus, the radiation characteristics are similar to those from bending magnets, apart from a 2N-fold enhancement of the intensity, where 2N is the number of the poles. An undulator is a N-period magnetic structure producing a gentle, periodic orbit. Because of the interference of radiation from different parts of the trajectory, the undulator radiation is squeezed into discrete spectrum and narrower emission angles. The result is an N_2-fold enhancement of the angular density of the flux in the forward direction. The spectral characteristics of radiation from bending magnets, wigglers and undulators are schematically illustrated. 41 references, 37 figures.

45941 Radio-frequency acceleration. Puglisi, M. pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

In the early days of cyclic RF accelerators the number of particles orbiting inside the machine was so small that the RF accelerating system was the least expensive and the most simple part of the machine. Less than twenty years later the situation was very much changed and now the opposite is true. The intensity of the accelerated current is so high and the required performances are so high that the RF accelerating systems are now a very sophisticated and expensive part of the whole machine. Moreover, it should be added that the major limitations to the possibility of an orbital machine now only come from the RF system. The same applies to linear accelerators where the machine itself is (as it was at the beginning) an RF device. Again at the dawn of the electromagnetic accelerators the linear accelerator was a small RF system with a very limited task. Now a tremendous effort is being made around the world to increase the fields and the intensity of the accelerated beam and this is generating a family of linear accelerators of increasing cost and complexity. 7 references, 35 figures, 1 table.

45942 Principles and technology of RFQs. Schempp, A. (Universitaet Frankfurt (West Germany)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The RFQ is a linear accelerator structure for low velocity ions which focuses and accelerates with the help of electrical radio-frequency (rf) quadrupole fields. It was first proposed by Kapchinskij and has since been applied in numerous labs mainly as injector for Alvarez accelerators. The RFQ can simultaneously focus, bunch, and accelerate a high current beam directly from the ion source, which can be on a relatively low dc potential. This allows the use of special ion sources which can be bulky and can have high power consumption like sources for polarized or highly charged ions. First, general principles of RFQ accelerators and typical limits imposed by particle dynamics are presented. Second typical problems of rf and mechanical design of this new type of accelerator are discussed, with the RFQ injectors built for DESY as examples to demonstrate typical properties of this type of low energy, high current injector. 28 references, 18 figures.

45943 Photocathode RF guns. Sheffield, R.L. (Los Alamos National Lab., NM (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Free-electron oscillators and amplifiers require electron accelerators capable of delivering pulse trains of electron bunches of high charge density in a wiggler or undulator. A high electron density implies a high peak current (100 A to 2000 A) and a low transverse beam emittance ($< 80\ \pi \times$ mm $\times$ mrad, determined by matching the transverse size of the electron beam to the optical beam in the wiggler). Electron beam collider machines also require high peak currents ($>$ 8 nC in picoseconds) with extremely small emittances ($< 10\ \pi \times$ mm $\times$ mrad). Several approaches have been proposed to attain such performance. This article discusses the use of photocathodes in attaining the aforementioned performance requirements. Photocathodes have been used as electron sources in lasertrons and for the production of spin-polarized electrons. A photocathode is a light-activated electron source that gives unprecedented control over all aspects of the electron distribution: peak current, spatial profile, and temporal profile. This control is possible because the electron distribution is not determined by grids or a cathode, but rather by an incident laser pulse on the photocathode. 44 references, 21 figures.

45944 Low emittance thermionic electron guns. Herrmannsfeldt, W.B. (Stanford Linear Accelerator Center, CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The author discusses self-field effects and external field effects for electron guns. He also discusses designs of electron guns and their uses in electron cooling systems and as an injector for electrostatic free electron lasers. He closes by looking at electron guns for linear accelerators. 20 references, 3 figures.

45945 Intense, low emittance injectors for RF electron linacs. Smith, T.I. (Stanford Univ., CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

A workshop on low emittance beams was held at Brookhaven National Laboratory from March 20 to March 25, 1987. The workshop was held under the auspices of the International Committee on Future Accelerators (ICFA), and was intended to explore issues relating to the production of electron beams with an unprecedented combination of high charge density and low emittance. The following material is largely a result of discussions held during the workshop, and represents an attempt to estimate the severity of some of the problems which would be encountered in the design of an RF linac injector consistent with the workshop goals. 12 references, 1 figure, 1 table.

45946 Free-electron lasers. Brau, C.A. (Vanderbilt Univ., Nashville, TN (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234--Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Free-electron lasers represent an altogether new and exciting class of coherent optical sources. Making use of a simple and elegant gain medium - an electron beam in a magnetic field - they

have already demonstrated broad tunability and excellent optical-beam quality. For the future they offer the possibility of generating the greatest focused power ever achieved by a laser. Even before this is achieved, the unique advantages of free-electron lasers, especially their tunability, will make them useful for a variety of important applications in science and medicine. The purpose of this chapter is to introduce the broad field of free-electron lasers before launching into the details of their operation and the technologies which support them. The chapter begins with a brief history of free-electron lasers, and then continues with a simple discussion of the basic principles of their operation. This is followed by a survey of the experiments which have been accomplished to date, and finally a discussion of some of the applications for which free-electron lasers seem particularly well suited. 116 references, 42 figures.

45947 Free-electron lasers. Pantell, R.H. (Stanford Univ., CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The purpose of the free-electron laser (FEL) is to convert the kinetic energy of an electron beam to electromagnetic energy. There are two primary components to the FEL: (1) A device for providing energetic particles. (2) A device for converting particle kinetic energy to radiation. Thus far, there has been a greater variety of approaches in the first category than in the second. To achieve energy transfer between a particle beam and a wave over an extended distance requires a synchronism condition between the electron velocity and the phase velocity of the wave. This presents a problem since, in vacuum, a plane wave has a phase velocity equal to c, the velocity of light, and the electrons have a velocity v such that $v < c$. In addition, since the electrons enter the system uniformly distributed along the direction of motion, bunching must occur so that a majority are in a phase of the field for which the wave extracts energy from the particles. At microwave frequencies the synchronism problem may be solved by using a periodic structure, as in a linac or TWT, such that a component of the wave that is established to match the periodic boundary propagates with a phase velocity equal to or less than c. This is not a good solution for infrared and visible wavelengths. 9 references, 17 figures, 1 table.

45948 Fundamentals of intense relativistic electron beams. Miller, R.B. (TITAN Technologies, Albuquerque, NM (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

An intense charged particle beam can be characterized as an organized charged particle flow for which the effects of beam self-fields are of major importance in describing the evolution of the flow. Research employing such beams is an important field with applications ranging from the development of high power sources of coherent radiation to inertial confinement fusion. In this series of lectures the primary goal is to provide a basic description of intense beam transport in a variety of situations of practical importance. First a brief summary is presented of the development of the pulse power technology which is often used to generate these beams, followed by an elementary description of intense beam behavior based on single-particle beam envelope equations. Then the author describes in some detail the behavior of intense beams in high-voltage diodes, and the important processes involved in beam transport in vacuum, in plasma, and in neutral gas. Much of this material is taken from my book, An Introduction to the Physics of Intense Charged Particle Beams (Plenum, 1982), which may be consulted for more information and references. 12 figures, 1 table.

45949 Coherence and statistical properties of photon beams with application to the free-electron laser. Bhattacharjee, A. (Columbia Univ., New York, NY (USA)); Gjaja, I. pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The subject of quantum optics has undergone considerable development in the last twenty-five years. Spurred by the invention of the laser, the theoretical understanding of the coherence and statistical properties of optical beams has now attained a stage of maturity where it is possible to treat different kinds of light sources. Over approximately the latter half of this period of development in quantum optics, the free-electron laser (FEL) has been developed to the point where it is now regarded as a tunable light source of considerable versatility, with prospects of producing radiation over a wide range of wavelengths at large levels of power. Since the basic mechanism for radiation gain in an FEL can be understood in classical terms, much of the literature on the subject does not need to venture outside the domain of classical physics. However, it is natural that the coherence and statistical properties of photon beams produced by FEL's should be investigated as they are in conventional lasers, and that a quantum theory of the FEL should be necessary for this purpose. In this paper, the theory of coherence and statistics of photon beams is reviewed in general, with application to the FEL in particular. As far as the general theory is concerned, this paper may be regarded as a poor man's version of existing wisdom in quantum optics. The attempt here has been to distill the existing principles in a compact, self-contained way that will enable one to use them for a light source such as the FEL, which is the application of interest in this paper. 22 references, 1 figure.

45950 Antiproton source. Peoples, J. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

In the past 18 months the Antiproton Source and the Collider have evolved from designs under construction into real machines. On October 11, 1985, a few days before the start of a year-long shutdown to build the DO collision hall, the $\bar{p}$ Source stored 10^{10} antiprotons. On October 12 and 13 these antiprotons were accelerated to 800 GeV in the Tevatron and brought into collision with 800-GeV protons. In late 1986 the $\bar{p}$ Source and the Tevatron Collider were in their early stages of use, but their promise should be fulfilled in 1987. The Tevatron I project is Fermilab's entry into the colliding beam sweepstakes. It is an extraordinary one, largely because it will be the highest energy collider, by nearly a factor of three, until the early 1990's. It has already reached 1.6 TeV and is expected to approach 2 TeV within the next two years. Collisions take place in the Tevatron, the superconducting proton synchrotron that the Accelerator Division Staff built and commissioned as the Energy Saver over the past five years. This ring was transformed into a collider as part of the Tevatron I project, although strictly speaking only a few additions were needed to make this transformation. Since the Tevatron Collider has been described in other chapters in this book, only the performance specifications and their implications for physics are discussed here. 27 references, 18 figures, 5 tables.

45951 Resonant extraction at the tevatron. Harrison, M. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

At the most basic level, extraction is the process of persuading a circulating beam to leave the machine in a controlled fashion. This is accomplished by deflecting a certain proportion of the circulating beam away from the central machine orbit and into the start of the extraction channel, from which point it is then shaped and split before entering the experimental areas. Deflecting the beam into the extraction channel is achieved by moving the beam across a thin electrostatic septum. Several potentially applicable techniques are available for doing this. For a variety of reasons the method chosen to be implemented at the Tevatron was that of horizontal half-integer resonant extraction. Under this scenario the beam is slowly moved into a nonlinear resonance where the incoherent betatron amplitudes grow in a controlled way from turn to turn until the amplitude is large enough for deflection into the extraction channel.

This chapter starts by examining the resonant process. Then the effect of the finite machine aperture on extraction efficiency is shown. The specific layout of the extraction elements in the Tevatron is given, together with how they are used. Then the operational characteristics of the system is considered. Results from a Monte Carlo simulation of fast extraction are presented. The paper is concluded with a brief discussion of measurements and calculations of energy deposition in the superconducting magnets resulting from the beam losses incurred during the fast spill. 17 figures.

45952 **Design and operation of the quench protection system for the Fermilab tevatron.** Martin, P.S. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The operation of a superconducting accelerator, in addition to cryogenic requirements, introduces a new complexity not present in a conventional accelerator. A method is required for protecting the magnets from possible overheating or overvoltage conditions in the event that some magnets quench, that is, are elevated in temperature so that they are no longer superconducting. The development of that system is the topic of this chapter. Any quench protection system has two very important ingredients. First, it must be designed with sufficient integrity to remain functional even under abnormal circumstances. The magnets must be protected during power failures, for example. Quenches involving a large number of components can also be hazardous because of the redistribution of voltages during the quench. Some of the system integrity can be achieved through redundancy. Frequent testing of critical elements of the system also assures the overall integrity. Second, the quench protection system must protect against damage from quenches regardless of their location or the excitation current at the time. It is not sufficient to protect just the magnet coils; either the leads between magnets must be fully stabilized or the quench protection system must protect them. The next section presents a brief discussion of the basic properties of superconductors and the phenomenon of quench propagation. 10 references, 13 figures.

45953 **Technology and particle beams.** Hartill, D.L. (Cornell Univ., Ithaca, NY (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Particle beams have been developed over the past sixty years by physicists in order to do scattering and production experiments in high energy physics. The earliest beams were the alpha-particle beams from natural radioactive sources used by Rutherford to perform scattering experiments that led to the discovery that the atomic nucleus was very small in diameter compared to atomic diameters. Over this period the technology has ranged from MeV energy proton beams produced by dc and electrostatic generators to modern colliders which collide beams of antiprotons with protons at beam energies of 900 GeV. To contain these energetic beams large-scale superconducting magnets had to be developed and are now in routine use at Fermilab. The proposed SSC which consists of two superconducting magnet rings with protons circulating in opposite directions will provide collisions between 20-TeV protons. The scale of these machines has gone from tens of centimeters to 100 kilometers for the circumference of the SSC in the space of fifty years. The field of particle physics is at the most fundamental level of scientific research since it studies the forces and particle constituents of nature's particles that are the building blocks of matter as we know it. This field has an extensive literature and for the rest of this overview only the technological applications of particle beams will be considered. 11 references, 3 figures.

45954 **General overview and a review of storage rings, research facilities, and insertion devices.** Winick, H. (Stanford Synchrotron Radiation Lab., CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). DOE Contract AC03-82ER13000. (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Synchrotron radiation, the electromagnetic radiation given off by electrons in circular motion, is revolutionizing many branches of science and technology by offering beams of vacuum ultraviolet light and x rays of immense flux and brightness. In the past decade there has been an explosion of interest in these applications leading to increased exploitation of existing rings and activity to construct new research facilities based on advanced storage rings and insertion device sources. Applications include basic and applied research in biology, chemistry, medicine, and physics plus many areas of technology. In this article they present a general overview of the field of synchrotron radiation research, its history, the present status and future prospects of storage rings and research facilities, and the development of wiggler and undulator insertion devices as sources of synchrotron radiation. 66 references, 20 figures, 1 table.

45955 (DOE/FTR–9015526) **[Ion sources, electron guns and beam optics]: Foreign trip report, June 7–14, 1989; July 1–19, 1989.** Prelec, K. Brookhaven National Lab., Upton, NY (USA). 7 Aug 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. Order Number DE89015526/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Advanced Source Development Group at BNL is currently involved in feasibility studies to replace heavy ion beams from a tandem accelerator with a possibly much more efficient and reliable EBIS, coupled with an RFQ accelerator. Discussions with Dr. Liljeby of the M. Siegbahn Institute and with Professor M. Sedlacek of the Royal Institute of Technology were focused on the BNL approach in the design of an electron gun or such a source. In addition, I got acquainted with Dr. Liljeby's experience in the operation of their EBIS. CERN Laboratory in Geneva, Switzerland, is presently considering acceleration of lead ions in their SPS (with a fixed target), as well as acceleration of heavy ions in the proposed Large Hadron Collider (LHC), in the colliding mode similar to BNL's RHIC project. Discussions were held with Drs. H. Haseroth and K. Schindl on both the LHC and RHIC projects. With Ch. Hill, who is in charge of the CERN preinjectors, experiences were compared with volume H^- ion sources, while discussions with M. Weiss were a follow-up of the joint work going on since 1984 on ion optics and RFQ acceleration.

45956 (FNAL-TM–1595) **SSC superconducting dipole magnet cryostat model style B construction experience.** Engler, N.H.; Bossert, R.C.; Carson, J.A.; Gonczy, J.D.; Larson, E.T.; Nicol, T.H.; Niemann, R.C.; Sorensen, D.; Zink, R. Fermi National Accelerator Lab., Batavia, IL (USA). Mar 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890270–22: International industrial symposium on the super collider, 8-10 Feb 1989). Order Number DE89015971/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A program to upgrade the full scale SSC dipole magnet cryostat model function and assembly methods has resulted in a series of dipole magnets designated as style B construction. New design features and assembly techniques have produced a magnet and cryostat assembly that is the basis for Phase 1 of the SSC dipole magnet industrialization program. Details of the assembly program, assembly experience, and comparison to previous assembly experiences are presented. Improvements in magnet assembly techniques are also evaluated. 6 refs., 5 figs.

45957 (FNAL-TM–1597) **Piping instability resulting from bellows misalignment.** Nicol, T.H. Fermi National Accelerator Lab., Batavia, IL (USA). 30 May 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE89015586/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The failure of the single phase bellows and magnet test stand during quench testing of SSC dipole magnet DD0011 has led to much speculation about the inherent stability of operating SSC magnets. This note addresses the problem of instabilities resulting from both translational and angular misalignment between pipes connected by bellows in the general sense and with respect to the SSC single phase system specifically. Note that none of the instabilities referenced here result from bellows 'squirm'. Inelastic bellows failure is not within the scope of this work. The failure mode referenced here is an elastic instability. 3 refs., 7 figs.

45958 (FNAL-TM–1600) **A Main Ring bunch length monitor by detecting two frequency components of the beam.** Ieiri, T.; Jackson, G. Fermi National Accelerator Lab., Batavia, IL (USA). 2 Jun 1989. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE89014016/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

The bunch length is measured by detecting two revolution frequency harmonics of the beam and taking the ratio of their amplitudes. Two heterodyne receivers have been made to direct them, one at 53MHz and the other at 159MHz. These signals are picked-up by a stripline detector. An analog circuit provides a signal proportional to the bunch length. The monitor measures variation of the bunch length as a function of time in the Main Ring. The measured signal, which sometimes shows that the bunches are tumbling in phase space, can be damped by feedback to the RF amplitude modulator. 9 refs., 12 figs., 1 tab.

45959 (INIS-BR–1570) **Design, construction and test of a corrector coil set for magnetic field homogenization of a dipolar magnet.** Pires, L.R. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1987. 89p. (In Portuguese). Order Number DE89636444/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

A method to improve the homogeneity of the distribution of the magnetic flux density in the gap of a dipole magnet. It is based on correcting the magnetic field by means of a system of coils, which employs etching thin copper foils, similarly as those for electronic circuits, is presented. The advantage of this method lies on its simplicity, its small space use, and its low price. The method was applied to correct the field of a dipole magnet, and it worked properly. (author).

45960 (LA-UR–89-2792) **Rf deflector-chopper for SSC [Superconducting Super Collider] injector.** Guy, F.W.; Bhatia, T.S. Los Alamos National Lab., NM (USA). [1989]. 6p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-36. (CONF-890803–6: International conference on high energy accelerators, 20-26 Aug 1989). Order Number DE89016976/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

In a proposed SSC linac injector the Low-Energy Booster lattice painting scheme requires a 50-MHz microbunch structure with transverse and longitudinal normalized rms emittances of less than 0.45 π-mm-mrad and 1.7×10^{-5} $\pi \cdot eV \cdot s$, respectively, at 600 MeV. A 50-MHz RFQ design does not meet the longitudinal emittance requirements; a 150-MHz RFQ can do so, but requires a chopping scheme that produces a clean 50-MHz beam structure without degrading emittance. We present an rf deflector-chopper conceptual design that converts a 150-MHz RFQ beam into a 50-MHz microbunch beam structure while matching transversely and longitudinally to a following 450-MHz DTL. Multiparticle simulation with 3-D space charge shows negligible emittance growth. Output beam emittances are factors of 3 below requirements; further acceleration to 600 MeV should produce only small additional growth. The chopper is 54 cm long, comprising an rf deflector, two rebunchers, five small permanent magnet quadrupoles, and a beam dump. Similar schemes could use a 200- or 250-MHz RFQ for even smaller longitudinal emittance. 6 refs., 5 figs., 2 tabs.

45961 (LBL–26824) **Testing of a H_2^+ enriched ion source for deuterium simulation.** Williams, M.D.; Leung, K.N.; Brennen, G.M.; Burns, D.R. Lawrence Berkeley Lab., CA (USA). Jun 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890703–16: International conference on ion sources, 9-15 Jul 1989). Order Number DE89015968/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have tested a McDonnell Douglas short multi-cusp plasma generator, designed to generate a positive hydrogen ion beam which is enriched with H_2^+ ions. Initial testing shows that the prototype source is capable of producing a positive hydrogen ion beam with H_2^+ percentage greater than 85%. The total ion current density was 56 mA/cm^2. For a higher current density of 110 mA/cm^2, the percentage of H_2^+ ions is approximately 73% as measured by a magnetic deflection spectrometer. A comparison between tungsten and lanthanum hexaboride cathodes shows that tungsten filaments can provide better performance. We have also operated the Berkeley 7.5-cm-diam. multicusp source without the magnetic filter. It is found that this source is also capable of generating H_2^+ fractions larger than 75%. 7 refs., 6 figs.

45962 (SAND–89-7073) **Aurora oil switch upgrade program.** Warren, T. Sandia National Labs., Albuquerque, NM (USA); Physics International Co., San Leandro, CA (USA). Mar 1989. 69p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789. Order Number DE89015192/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This report describes the short pulse synchronization requirements, the original Aurora trigger scheme, and the PI/SNLA approach to improving the synchronization. It also describes the oil switching design study undertaken as the first phase of the program. A discussion of oil-switch closure analysis and the conceptual design motivated by this analysis are presented. This paper also describes the oil-switch trigger pulser tests required to validate the concept. This includes the design of the testing facility, a description of the test goals, and a discussion of the results. This paper finally describes oil-switch trigger pulser testing on one of the four Aurora Blumlein modules, which includes the hardware design and operation, the testing goals, hardware installation, and test results. 9 refs., 26 figs.

45963 (SLAC–340) **Optical tuning in the arcs and final focus sections of the Stanford Linear Collider.** Bambade, P.S. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Mar 1989. 224p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. Order Number DE89015620/JAW. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

In this thesis, we present the experimental tuning procedures developed for the Arcs and for the Final Focus Section of the Stanford Linear Collider (SLC). Such tuning is necessary to maximize the luminosity, by minimizing the beam size at the interaction point, and to reduce backgrounds in the experiment. In the final Focus Section, the correction strategy must result from the principles of the optical design, which is based on cancellations between second order aberrations, and on the ability to measure micron-size beams typical of the SLC. In the Arcs, the corrections were designed after the initial commissioning, to make the system more error-tolerant, through a modification in the optical design, and to enable adjustments of the beam phase-space a the injection to the Final Focus System, through a harmonic perturbation technique inspired from circular accelerators. Although the overall optimization of the SLC is not entirely finished, an almost optimal set-up has been achieved for the optics of the Arcs and of the Final Focus Section. Beams with transverse sizes close to the nominal ones, of a few microns, have been obtained at the interaction point. We present and discuss our results and the optical limits to the present performance. 24 refs., 25 figs., 2 tabs.

45964 (SLAC-PUB–5026) **An immersed field cluster klystron.** Palmer, R.B.; Herrmannsfeldt, W.B.; Eppley, K.R. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890803–3: International conference on high energy accelerators, 20-26 Aug 1989). Order Number DE89015633/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Future linear colliders have a need for high power, high frequency, and short-pulse radio frequency sources. The proposed "cluster klystron" should give over 1 GW of 12 GHz radio frequency power, can employ direct current or a long high-voltage pulse, but can be gated to give pulses down to a few tens of nanoseconds. The device consists of 42 parallel 100 A channels. Each channel is fed from an individual magnetron-type gun employing a common 50 kV mod-anode. The beams are accelerated to 400 kV in common dc accelerating gaps and fed into the 42 separate klystron channels. Focusing of all channels is achieved by a single overall 4 kG magnetic field. Simulations of expected performance suggest that the efficiency could be above 70%. 10 refs., 6 figs., 5 tabs.

45965 (SLAC-PUB–5034) **Bunch compression for the TLC [TeV Linear Collider].** Kheifets, S.A.; Ruth, R.D.; Fieguth, T.H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890803–8: International conference on

high energy accelerators, 20-26 Aug 1989). Order Number DE89016944/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The length of the bunch for the TeV Linear Collider (TLC) must be decreased, while simultaneously preserving its small transverse emittance. To achieve a short bunch length ($\sim$ 70 μm) needed for the TLC, it is necessary to use two-step compression of a 5 mm bunch which is extracted from the damping ring. The corresponding increase of momentum spread requires that chromatic aberrations of the transport line must be corrected at least up to second order. This goal is achieved by building the compressor out of second-order achromats, which also eliminates geometric aberrations. The utilization of flat beams restricts the design to an uncoupled, mid-plane symmetric transport line. The first compression is performed by a conventional compressor. For the second, it is possible to use a 180° bend. The emittance growth due to the synchrotron radiation is kept to several percent. 10 refs., 3 tabs.

45966 (SLAC-PUB–5050) **Energy matching of 1.2 GeV positron beam to the SLC [Stanford Linear Collider] damping ring.** Clendenin, J.E.; Helm, R.H.; Jobe, R.K.; Kulikov, A.; Sheppard, J.C. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890803–1: International conference on high energy accelerators, 20-26 Aug 1989). Order Number DE89015638/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Positrons collected at the SLC positron source are transported over a 2-km path at 220 MeV to be reinjected into the linac for acceleration to 1.2 GeV, the energy of the emittance damping ring. Since the positron bunch length is a significant fraction of a cycle of the linac-accelerating RF, the energy spread at 1.2 GeV is considerably larger than the acceptance of the linac-to-ring (LTR) transport system. Making use of the large pathlength difference at the beginning of the LTR due to this energy spread, a standard SLAC 3-m accelerating section has been installed in the LTR to match the longitudinal phase space of the positron beam to the acceptance of the damping ring. The design of the matching system is described, and a comparison of operating results within simulations is presented. 5 refs., 4 figs., 1 tab.

45967 (SLAC-PUB–5054) **A 2-MeV microwave thermionic gun.** Tanabe, E.; Borland, M.; Green, M.C.; Miller, R.H.; Nelson, L.V.; Weaver, J.N.; Wiedemann, H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8909183–1: 14. meeting on linear accelerators, 7-9 Sep 1989). Order Number DE89015640/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A high-gradient, S-band microwave gun with a thermionic cathode is being developed in a collaborative effort by AET, Varian, and SSRL. A prototype design using an upgraded Varian dispenser cathode mounted with thermal isolation directly in the first half-cell of a 1-1/2 cell, side-coupled, standing-wave cavity has been fabricated and is being tested. Optimization of the cavity shape and beam formation was done using SUPERFISH, MASK, and PARMELA. An overview of design details, as well as the status of in-progress beam tests, will be presented. 9 refs., 6 figs.

45968 (SLAC-PUB–5059) **Field emission and rf breakdown in copper linac structures.** Loew, G.A.; Wang, J.W. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-890803–9: International conference on high energy accelerators, 20-26 Aug 1989). Order Number DE89016949/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

This paper presents a status report on rf field emission and high-gradient breakdown studies in linac structures at SLAC. The motivation behind these studies, begun in 1984, is to determine the maximum accelerating field gradients that could be used safely in future $e^{\pm}$ colliders, to contribute to the basic understanding of the rf breakdown mechanism, and to discover if special surface treatments might make it possible to shorten the time needed for rf processing and to supersede the field limits presently reachable in room temperature copper structures. Both theoretical ideas and experimental results are discussed. 8 refs., 3 figs., 1 tab.

45969 (UCRL–100366) **A new streak tube design with a high signal to noise ratio and fast time response.** Bowers, M.W. Lawrence Livermore National Lab., CA (USA). 11 Jul 1989. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890836–9: 33. SPIE annual international technical symposium on optical and optoelectronic applied science and engineering, 6-11 Aug 1989). Order Number DE89016500/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A new streak tube is in the preliminary design and review phase. Modeled after the newly designed microchannel-plate (MCP)-based x-ray-framing camera at the Lawrence Livermore National Laboratory (LLNL), this streak tube incorporates an MCP at the light input to amplify the signal before noise is introduced into the system. The signal-to-noise ratio of the streak tube is directly dependent on the gain setting of the MCP and can thus be greater than 1000:1. Temporal resolution will be about 30 ps, and the dynamic range should be greater than 500:1. Another tube of the same design, but employing a photocathode instead of the photocathode/MCP combination, has been studied briefly. With some minor modifications, it should be possible to achieve a dynamic range of about 20 with this version of the design, and to reduce the magnification to about 1 and improve the time response to 150 fs. 4 refs., 5 figs.

45970 Bunched beam diagnostics. Siemann, R.H. (Cornell Univ., Ithaca, NY (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

There is a remarkable diversity in the field of accelerator physics. Look at the proceedings of any conference. Papers range from Hamiltonian dynamics to the latest improvements of performance in accelerator X to the engineering of specialized equipment. Beam diagnostics is somewhere in the middle of this. Diagnostic instruments make the connection between theories and observations, and the capabilities of these instruments influence strongly our ability to improve performance. The gave a series of lectures in 1987 on the general topic of Principles of Beam Observation. The emphasis was on frequency domain analysis of beam generated signals in storage rings, and that is the subject of this paper. The goal is to connect spectrum analyzer observations to what the beam is doing. In addition, understanding beam spectra is essential for understanding coherent effects and instabilities in storage rings, and this is discussed extensively. 23 figures, 4 tables.

45971 Fields, impedances, and structures. Ng, K. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

Beam particles interact directly with other beam particles or indirectly through the electromagnetic fields reflected back from the walls of the vacuum chamber. The interaction between the fields and a bunch may lead to coherent motions of the particles inside the bunch resulting in instabilities. For the SSC, the bunch intensity is very low because they want to limit the event rate at collision. Thus the single-bunch instabilities encountered in bunched beam storage rings may not be an important issue here. However, in order to reach a designated luminosity, the number of bunches is enormous. The electromagnetic fields inside the vacuum chamber can couple bunches together and let them oscillate coherently, leading to multi-bunch instabilities. A real impedance will cause parasitic beam energy loss. This will cause heating of the vacuum chamber, some of which occurs at liquid helium temperature and thus contributes to the cryogenic load. The space-charge impedance will lead to a tune shift in single-particle betatron motion,

which can increase the transverse beam size and even lead to instability. For other machines such as an electron storage ring, the rate of interaction decreases sharply with energy. To maintain a certain event rate, it would be preferable to have a particle beam with as high an intensity as possible and as small emittances as possible. Although there are techniques to attain high intensity and low emittances, they are often limited by single-bunch instabilities. As a result, these impedances must be kept low enough for a beam of high luminosity to be possible. In this chapter, the electromagnetic fields left by a particle after traversing some structures of the vacuum chamber is discussed. Next, coupling impedances are defined in terms of the wakefields. They are then estimated for various discontinuities in the chamber. 24 references, 17 figures, 1 table.

45972 Advanced nonlinear theory: long-term stability at the SSC. Heifets, S. (Continuous Electron Beam Accelerator Facility, Newport News, VA (USA)). pp. 1136 of Physics of particle accelerators. Volume 1. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.1-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The SSC is supposed to be one of the most stable dynamic systems. The luminosity lifetime of one day means that particles have to be in regular, stable, bounded motion for 10_8 revolutions. This is only an order of magnitude less than the lifetime of the solar system. The problem of beam stability, one of the main problems in the theory of accelerators, has many aspects: one-particle dynamics, and intrabeam, beam-environment, and beam-beam interactions. Here only the first problem - the dynamics of a single particle is addressed. 36 references, 9 figures.

45973 Superconducting magnet system. Dahl, P. (Brookhaven National Lab., Upton, NY (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The superconducting magnet system for the SSC is unprecedented in technical scope and, manifestly, the costliest machine component as well. A total of 7680 superconducting dipoles are required for bending the two proton beams in the regular arcs of the lattice, 1356 quadrupoles for focusing, and $\sim$ 1600 spool pieces housing correction windings and other instrumentation. In addition, $\sim$ 650 special magnets are required to bring the two counter-rotating beams into collision in the interaction regions of the experimental areas. Altogether, the magnet system comprises nearly 13,000 superconducting magnets representing an investment of three quarters of a billion dollars. The most critical magnets, because of their demanding operating specifications and sheer number, are the regular dipoles; consequently, the design effort has concentrated on them. The dipole field strength determines the circumference of the collider rings and thus the cost of the tunnel. Therefore the operating field is chosen to be as high as practical, consistent with a judicious balance between sound magnet design principles and minimum unit cost. The minimum required coil aperture (coil i.d.) and available superconductor current density dictate the overall magnet size and hence its cost. (The superconductor alone accounts for $\sim$ 30% of the cost.) The good-field aperture must be large enough to accommodate the circulating beam, particularly at injection. The uniformity of the magnetic field determines the lifetime of the stored beams. The operational life of the collider facility and fraction on time for physics experiments depends on magnet reliability and on a conservative design. It goes without saying that the feasibility of large superconducting magnet systems is partly due to concomitant progress in large-scale helium refrigeration technology. 13 references, 22 figures, 11 tables.

45974 SSC project. Peoples, J. (Lawrence Berkeley Lab., CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The SSC is a 20-TeV, proton-proton collider proposed for construction by the US Department of Energy (DOE). Completion is planned for the mid-1990s. A technical description of the accelerator is given along with a report on the status of the project. 8 references, 3 figures, 5 tables.

45975 Parameter choices for the SSC. Peterson, J.M. pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The design of the Superconducting Super Collider has followed from the basic requirement that it produce observable reactions among the elementary constituents of matter at as high an energy as now possible. The basic design parameters are that proton beams of 20 TeV be brought into collision at six interaction points in such a way as to produce a luminosity of 10^{33} $cm^{-2}s^{-1}$ per collision point. A collider arrangement is chosen to reach the highest possible energy. A 20-TeV proton collider provides 40 TeV of available energy in the center of mass, whereas a 20-TeV fixed-target proton machine has only 0.194 TeV in the center of mass of a proton-nucleon collision. The energy of 20 TeV for each beam is determined by the particle physics to be investigated. High in priority will be new particles with masses in the TeV range that are produced by parton-parton (quark, anti-quark, gluon) collisions. Since each parton carries on the average only a third or so of the proton beam energy, 20 TeV is a practical minimum for investigating this physics domain. A proton-proton collider, rather than a proton-antiproton collider, is chosen because of the greater intensity that can be obtained with protons. Although the antiproton, because of its antiquark composition, would be inherently advantageous in producing some new particles, this small advantage is outweighed by the greater (x10) luminosity available in proton-proton machines. 3 references, 4 figures, 1 table.

45976 Supercollider physics. Quigg, C. (Lawrence Berkeley Lab., CA (USA)). pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The first order of business will be to summarize the microscopic description of matter. The author reviews the evidence for quarks and leptons as fundamental constituents and explains the strategy of gauge theories of the fundamental interactions. Next, he discusses questions the Standard Model raises but cannot answer. A frontier where the current understanding ceases to make sense, where the clues that will lead us to a more satisfying description of Nature will have to be found can be defined. That frontier lies at energies of about 10^{12} electron volts for collisions among the fundamental constituents. The instrument of choice for reaching this new energy scale is a high-energy, high-luminosity, proton-proton collider. He concludes by summarizing the status of the American project known as the Superconducting Super Collider, or SSC. 13 figures.

45977 (SLAC-PUB–5038) **Design of a high luminosity collider for the Tau-Charm Factory.** Oide, Katsunobu. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–6: Tau-Charm workshop, 23-27 May 1989). Order Number DE89015635/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Important relations between basic parameters of a high-luminosity collider are discussed. As the result, it is shown that the maximum bunch spacing is limited by the beam current to clear the threshold of the bunch lengthening. In order to solve the short bunch spacing, the crab-crossing scheme is applied to the design of a ring with 2.2 GeV, 2 x 10^{33} $cm^{-2}s^{-1}$ luminosity. 8 refs., 5 figs.

45978 Reactive impedance of a smooth toroidal chamber below the resonance region. Ng, K. (Superconducting Super Collider Central Design Group, Lawrence Berkeley Laboratory, Berkeley, California 94720(US)); Warnock, R. *Physical Review [Section] D: Particles and Fields (USA),* 40(1): 231-243 (1 Jul 1989). DOE Contract AC03-76SF00515.

We evaluate the longitudinal coupling impedance of a smooth toroidal vacuum chamber in the domain of frequencies below the

first synchronous resonant mode. The chamber has rectangular cross section. With infinite wall conductivity, as assumed here, the nonresonant impedance is purely reactive. It consists of a space-charge term proportional to $1/\gamma^2$ and a curvature term which survives even when $\gamma \rightarrow \infty$. In the entire subresonant domain, the curvature term is well represented as a quadratic function of frequency: namely, $Z/n = iZ_0(h/\pi R)^2[A - 3B(\nu/\pi)^2]$, where h is the height of the chamber and R is the trajectory radius and $\nu = \omega h/c$. The constants A and B are of order 1, being nearly equal to 1 if the width of the chamber is somewhat greater than its height. Thus, $\mathrm{Im}Z/n$ from curvature is typically a very small fraction of an ohm below the resonance domain, which begins when $\nu > (R/h)^{1/2}$. Consequences for beam stability, if any, arise from high-frequency resonances which can produce values of several ohms for Z/n.

45979 Review of synchrotron beam stability and stabilizing systems. Hettel, R. (Stanford Synchrotron Radiation Laboratory, Stanford, California 94305 (US)). *Review of Scientific Instruments (USA),* 60(7): 1501-1506 (Jul 1989). DOE Contract AC03-82ER13000.

Fluctuations of the stored beam orbit, together with the vibration and thermal distortion of beamline optical components, introduce photon beam position and angle instabilities at distant experimental stations and degrade data quality for many experiments. Systems employing sensitive photon beam position monitors have been devised to reduce the magnitude of these disturbances to tolerable levels. Desired stability levels for the vertical plane, in which the beam is highly collimated, are 10 μm in position and 1 μrad in angle. Horizontal stabilizing systems are also being developed for certain undulator and horizontally focused beams that are likewise adversely influenced by small motions. An order of magnitude increase in stability requirements is expected for the next generation of very low emittance and small aperture beam sources. Achieving this stability will depend on the combined efforts of storage ring mechanical, electrical, and lattice designers as well as on the development of improved position monitoring and beamline optical systems.

45980 (AD-A-207768/3/XAB) **Response functions of a BC501 scintillation detector for neutrons up to 41 MeV. Final report, March 1985-December 1987.** Kiziah, R.R.; Snell, M.P. Air Force Weapons Lab., Kirtland AFB, NM (USA). Apr 1987. 67p. (AFWL-TR-88-33). Available from NTIS, PC A04/MF A01.

Using time-of-flight and pulse-shape discrimination techniques, the response functions of a 5-cm-long by 5-cm diam BC501 liquid organic scintillation detector were measured for nearly monoenergetic neutrons at 43 energies between 2 and 41 MeV. Absolute normalization of the neutron pulse-height distributions for energies less than 31 MeV was performed by matching the largest pulse-height regions, the proton-recoil plateaus, of the distributions to Monte Carlo calculations of the detector response. The remaining distributions were normalized through comparison of experimental and calculated integral efficiencies. The 32 BC501 neutron response functions at energies between 2 and 22 MeV agree well with published response functions of a 4.60-cm-long by 4.65-cm-diam NE213 scintillation detector when simple corrections are applied for differences in density, composition, size, and normalizing cross-sectional area between the detectors. This set of BC501 response functions is to be used for construction of a detailed response matrix for unfolding neutron pulse-height distributions up to energies of 41 MeV. With simple scale adjustments, the response functions can also be used for unfolding pulse-height distributions acquired with an equal-sized NE213 scintillation detector.

45981 (AD-A-207901/0/XAB) **Instrumentation for radiological emergency responses. Memorandum report.** Klopcic, J.T. Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab. May 1989. 34p. (BRL-MR-3761). Available from NTIS, PC A03/MF A01.

This report provides an overview of the instrumentation and associated techniques that would be used to perform radiological monitoring at an accident/incident involving the release of radioactive materials. This article is not intended to serve as a user's manual for the various instruments. However, it is intended to include sufficient detail to provide an appreciation and use of such techniques in case of an emergency. For completeness, some elementary characteristics of different kinds of radiation are also included. Quantitative measurements of radioactive contamination in the field is extremely difficult. Particles having short ranges, such as alpha and low-energy beta radiation, are significantly and incalculably affected by minute amounts of dust or precipitation. Therefore, detection - rather than measurement - is a more realistic goal for alpha-beta surveys. More-penetrating radiations such as gamma and higher energy x-rays are less effected by such overburden.

45982 (AECL-9432) **Heavy water solar neutrino detector.** Earle, E.D.; Sudbury Neutrino Observatory Collaboration. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Apr 1987. 32p. (CONF-870279-: Lake Louise winter institute meeting, 15-21 Feb 1987; SNO-87-4). Order Number DE89635584/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The construction of a solar neutrino observatory utilizing 1000 tonnes of D_2O in a nickel mine near Sudbury is proposed. The rationale for such an observatory, the characteristics of the detector and its sensitivity are discussed. Recent progress in resolving some of the problems in the construction and operation of the detector are outlined. Technical measurements and engineering designs are in progress with a view to preparing detailed cost estimates. 48 refs.

45983 (BONN-IR-88-42) **Studies on the optimization of the ZEUS transition-radiation detector.** Kiehm, H. Bonn Univ. (Germany, F.R.). Physikalisches Inst.; Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet. Aug 1988. 54p. (In German). Order Number DE89915160/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

This paper describes the results of test measurements, made with pre-prototypes of the ZEUS-TRD. We used longitudinal drift chambers filled with 90% xenon and 8% CO_2/2% iso-C_4H_{10} as quench gases. The readout was made by 6bit nonlinear FADC's with an effective dynamic range of 8bits. The used amplifiers were types built in SMD-technique with high amplification factors. Pole-Zero filters to make the pulses shorter and better reconstructable were build in. The cathode wires, wires that separate the drift region from the amplification region, were also read out, and showed signal structures similar to that of the signal-wires. These cathodes, fixed perpendicular to the sense wires, are useful to identify double tracks. New radiator types, based on polypropylen fibres have been tested. We found that the coating of the fibre surfaces is very bad for the production of transition radiation. To separate hadrons from electrons we used 3 different total-charge methods; two of them preferred cluster-structures. For the test we took data on the base of one chamber and simulated 4 chambers (the final ZEUS-TRD will have 4 ones) with a liklihood-algorithm. We took the data at the CERN PS at 1-10 GeV with a mixed particle beam am. For an electron efficiency of 90% we found the following pion contaminations: minimum contamination at 4 GeV 1.7%, maximum contamination at 10 GeV 3.1%. (orig.).

45984 (BONN-IR-88-44) **Construction and test of a neutron detector for the PHOENICS experiment.** Kueckes, M. Bonn Univ. (Germany, F.R.). Physikalisches Inst.; Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet. Aug 1988. 37p. (In German). Order Number DE89915159/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

A neutron detector consisting of 23 scintillation counters (20x20x100 cm^3) has been built and tested. This device is part of the PHOENICS experiment at the new Electron-Stretcher-Accelerator ELSA. A spatial resolution of 3 cm and a time resolution of 175 ps could be achieved. (orig.).

45985 (BONN-IR-88-49) **Studies on the angular and momentum resolution of the hadron spectrometer at the ELAN**

experiment. Schoenwald, D. Bonn Univ. (Germany, F.R.). Physikalisches Inst.; Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet. Sep 1988. 74p. (In German). Order Number DE89915162/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

By MC calculations with the simulation program for the hadron spectrometer the accuracy in the determination of starting momentum, starting angles, and starting position reachable with the hadron spectrometer was studied. The calculations show that the reachable accuracy is essentially constrained by two factors. These are on the one hand the multiple Coulomb scattering on the target, on the air, and on the detection elements as well as on the other hand the finite resolution of the proportional chambers. The extension of the multiple Coulomb scattering is dependent both on the momentum and on the mass of the hadron. At increasing momentum and decreasing mass decreases the influence of the multiple scattering. The influence of the multiple Coulomb scattering on the resolutions in comparison to the influence of the finite angular resolution of the proportional chambers on the resolutions varies much between the single back-calculational quantities. Approximation formulas for the resolution of the hadron spectrometer in the starting momentum, starting angles, and the starting position in dependence on the starting momentum could be stated. (orig.).

45986 (BONN-IR-88-58) **A measuring facility for the uniformization of the optical readout at the ZEUS calorimeter.** Jahnen, G. Bonn Univ. (Germany, F.R.). Physikalisches Inst.; Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet. Oct 1988. 51p. (In German). Order Number DE89915161/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

The ZEUS-detector for HERA features a high resolution calorimeter of the sampling type. The passive layers are made of depleted uranium and the active layers are of aromatic scintillator. The layer thicknesses are chosen to yield full compensation, i.e. for a given energy electrons or photons produce the same signal as hadrons or jets. The scintillators are read out via wave length shifter bars. A uniform response of the wave length shifter i.e. a response independent of the entrance position of the scintillator light, is essential to obtain best possible resolution. This diploma thesis concentrates on the apparatus and the procedure to produce wave length shifters for the electromagnetic sections of the ZEUS forward calorimeter to better than +-2%. (orig.).

45987 (EUR-11755, pp. 125-139) **Pips-technology for α,β and γ measurements.** Burger, P.; Schoenmaekers, W. Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8712146--: Experts' meeting, 3-4 Dec 1987). In *Aerosol measurements and nuclear accidents: A reconsideration.* Order Number DE89908161/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

The paper reviews the basic properties of nuclear detectors and gives a short description of the major available detector types. It subsequently discusses Passivated Implanted Planar Silicon technology and its applications in nuclear metrology.

45988 (EUR-11755, pp. 140-155) **Metrology of radioactive aerosols with automatic self-checking monitors.** Frenzel, E. (Erlangen-Nuernberg Univ., Erlangen (DE)). Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8712146--: Experts' meeting, 3-4 Dec 1987). In *Aerosol measurements and nuclear accidents: A reconsideration.* Order Number DE89908161/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

The paper gives a technical description of an aerosol monitor for determining low concentrations of artificial radioactive aerosols in the atmosphere. The principle of measurement consists of determining the natural beta aerosol radioactivity concentration and subtracting it from the gross beta radioactivity concentration, based on a simultaneous alpha and beta measurement. The performance of the monitor is demonstrated with laboratory experiments and experiences related to the Chernobyl accident. The paper also describes further developments in the field using modern nuclear detectors.

45989 (FNAL/C-89/155-E) **New tools for the simulation and design of calorimeters.** Womersley, W.J. Fermi National Accelerator Lab., Batavia, IL (USA). 10 Jul 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-8905194-3: 4. Pisa meeting on advanced detectors: frontier detectors from frontier physics, 21-26 May 1989). Order Number DE89016323/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Two new approaches to the simulation and design of large hermetic calorimeters are presented. Firstly, the Shower Library scheme used in the fast generation of showers in the Monte Carlo of the calorimeter for the D-Zero experiment at the Fermilab Tevatron is described. Secondly, a tool for the design future calorimeters is described, which can be integrated with a computer aided design system to give engineering designers an immediate idea of the relative physics capabilities of different geometries. 9 refs., 6 figs., 1 tab.

45990 (FNAL-TM-1602) **Technical memo on PbF_2 as a Cherenkov radiator for EM calorimetry.** Anderson, D.F. Fermi National Accelerator Lab., Batavia, IL (USA). 26 Jun 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE89014014/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

It is apparent that the ever increasing rates and radiation levels found in high-energy physics are excluding more and more instrumental techniques. Those techniques that are remaining are often pushed to their theoretical limits. This situation reaches an extreme at the proposed luminosity of the SSC. Also, it is fair to say that at the SSC, after the accelerator itself, calorimetry will be the next most important physics tool. Therefore, we should be ever alert to new calorimetry techniques which may operate in this demanding environment. The material lead fluoride, PbF_2, has a real potential of yielding a very compact, high-resolution electromagnetic calorimeter that is both fast and radiation hard. PbF_2 is not a scintillator but a Cherenkov radiator like lead glass, but with a radiation length even harder shorter than of BGO. This memo discusses this property as well as comparison PbF_2 to other scintillating materials. 2 refs., 14 figs., 1 tab.

45991 (FNAL-TM-1604) **Performance of the CAMEX64 silicon strip readout chip.** Yarema, R.J. Fermi National Accelerator Lab., Batavia, IL (USA). Jun 1989. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE89014015/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

The CAMEX64 is a 64 channel full custom CMOS chip designed specifically for the readout of silicon strip detectors. CAMEX which stands for CMOS Multichannel Analog MultiplEXer for Silicon Strip Detectors was designed by members of the Franhofer Institute for Microelectronic Circuits and Systems and the Max Planck Institute for Physics and Astrophysics. Each CAMEX channel has a switched capacitor charge sensitive amplifier with 4 sampling capacitors and a multiplexing scheme for reading out each of the channels on an analog bus. The device uses multiple sampling capacitors to filter and reduce input noise. Filtering is controlled through sampling techniques using external clocks. The device operates in a double correlated sampling mode and therefore cannot separate detector leakage current from a charge input. Normal operation of this device is similar to all other silicon readout chips designed and built thus far in that there is a data acquisition cycle during which charge is simultaneously accepted on all channels for a short period of time from a detector array, followed by a readout cycle where that charge or hit information is read out. This device works especially well for colliding beam experiments where the time of charge arrival is accurately known. However it can be used in fixed target or asynchronous mode where the time of charge arrival is not well known. In the asynchronous mode it appears that gain is somewhat dependent on the time interval required to decide whether or not to accept charge input information and thus the maximum signal to noise performance found with the synchronous mode may not be achieved in the asynchronous mode. 18 figs., 5 tabs.

45992 (FNAL-TM-1610) **Radiation measurements inside the CDF detector.** Yarema, R.J. Fermi National Accelerator Lab., Batavia, IL (USA). 20 Jul 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE89016016/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

During the last CDF experimental period from 6/88 to 6/1/89, radiation measurements were made inside the detector on or near the beampipe using various types of monitors. The purpose of the tests was to help predict the radiation levels for future electronics which must be located close to the interaction area. The results from two different types of monitors, PIN diodes and TLD's are reported in this paper. The TLD's (Harshaw/Filtrol type 700) are sensitive to x-rays, gammas, alphas, electrons, and protons. They are calibrated against a cesium source and corrected for nonlinear effects at higher radiation levels. The PIN diodes (Harshaw/Filtrol type DN-156) are sensitive only to neutrons. The devices are calibrated for 1 MeV neutrons and require correction factors for neutrons at other energy levels. All of the monitors were placed just outside of the VTPC, but still inside the CDF magnetic field. The monitors were located 68 inches from the center of the interaction region. The beam pipe is 2 inches in diameter. Therefore the closest monitoring points were on the beampipe or 1 inch from the beam. 5 figs., 2 tabs.

45993 (GSI–89-12) **Optimization and extension of the GSI double-orange apparature for the study of e^+e^- pairs emitted in heavy ion collisions.** Schroeter, A. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Technische Univ. Muenchen, Garching (Germany, F.R.). Fakultaet fuer Physik. May 1989. 116p. (In German). Order Number DE89915119/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

In order to study the mapping properties and detection probabilities of the double-orange apparature of the GSI for e^+e^- pairs from different pair production processes (two-body decay, IPC) detailed Monte-Carlo simulation calculations were performed. On the base of the results produced thereby a comprehensive extension of the apparature was performed in which among others a new heavy-ion detector system was added and the energy resolution, the counting-rate capacity, and the spatial acceptance angle of the lepton detectors were essentially improved. With the optimized apparature the collisional systems U+U and U+Pb were studied, whereby four times higher positron and e^+e^- coincidence detection rates than in comparable experiments with the old facility were reached. (orig.).

45994 (GSI–89-13) **Production, transport and charge capture measurements of highly charged recoil ions.** Trebus, U.E. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Texas A and M Univ., College Station, TX (USA). May 1989. 138p. Order Number DE89915120/JAW. Available from NTIS (US Sales Only), PC A07/MF A01.

An experiment is described to study highly charged recoil ions on-line to the heavy ion accelerator UNILAC at GSI. The highly charged recoil ions are produced by heavy ion bombardment of a gas target. Subsequently the slow highly charged recoil ions are extracted from the ionization volume, and guided through a beam transport line to a Wien filter for charge state selection and to a collision region to study charge transfer processes. Several experiments were carried out to show the efficient charge state separation. Charge states up to q=15 were observed. When using a retarding field analyzer cross sections for single electron capture were determined for different charge states of Xe^{q+} for q=4 to 11 and He gas. The experiments demonstrated increasing charge transfer cross sections with increasing charge state q and indicated the effect of near resonant charge capture for q=6. The flexible data acquisition system used, is described and other future experiments, such as for instance in flight ion-trapping are indicated in the appendix. (orig.).

45995 (INIS-BR–1561) **Vacuum ultraviolet spectroscopy of some hydrocarbons by electron impact technique.** Azevedo e Souza, A.C. de. Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro, RJ (Brazil). Jul 1985. 166p. (In Portuguese). Order Number DE89636479/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

A detailed description of the construction and operation of the electron impact spectrometer of the Electron Impact Laboratory at the Chemistry Institute of Federal University of Rio de Janeiro are presented. The main characteristics of this spectrometer are: incident energy from 0.5 to 3.0 KeV; angular range from -60^0 to $+ 60^0$; energy loss from 0 to 500 eV; energy resolution from 0.5 to 2.5 eV and; electron velocity analyser equal to electrostatic (Mollenstedt) type. The data acquisition system is based on a microcomputer Motorola; recently an APPLE II system has been incorporated to the spectrometer. Electron energy loss spectra for the nitrogen molecule as well as for some hydrocarbons (C_2H_6, C_2H_4, C_2H_2) have been obtained. The data were converted into double differential cross sections and generalized oscillator strenghts. (author).

45996 (INIS-BR–1599) **Development of nuclear magnetic resonance tomography technology - TORM.** Tannus, A. Sao Paulo Univ., Sao Carlos, SP (Brazil). Inst. de Fisica e Quimica. 1987. 228p. (In Portuguese). Order Number DE89636485/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

The development of hardware and software necessary to implement the Magnetic Resonance Imaging (MRI) techniques is described. The major subjects were the construction of an aquisition and control system which allowed the operation of a pulsed Fourier NMR spectrometer as a NMR Tomograph; further it was oriented the developing of a NMR spectrometer whose parameters could be easily reconfigured by the controlling system. As a result a sofisticated equipment which allows, more than the proposed, working with high resolution spectroscopic techniques and spectroscopy in solids, was obtained. Since the basic techniques employed in NMR and CT Tomographs are well known, a great emphasis was also given on the understanding of the image reconstruction techniques that constitutes today the frontier of research in this area. The results obtained with the system described here are considered good, comparable to the results from commercial units developed in cooperation with imaging groups located in universities abroad. (author).

45997 (INIS-BR–1603) **Multiwire proportional chamber for Moessbauer spectroscopy: development and results.** Costa, M.S. da. Universidade Federal, Rio de Janeiro, RJ (Brazil). Inst. de Fisica. Dec 1985. 99p. (In Portuguese). Order Number DE89636480/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

A new Multiwere proportional Chamber designed for Moessbauer Spectroscopy is presented. This detector allows transmission backscattering experiments using either photons or electrons. The Moessbauer data acquisition system, partially developed for this work is described. A simple method for determining the frontier between true proportional and semi-proportional regions of operation in gaseous detectors is proposed. The study of the tertiary gas mixture He-Ar-CH_4 leads to a straight forward way of energy calibration of the electron spectra. Moessbauer spectra using Fe-57 source are presented. In particular those obtained with backsattered electrons show the feasibility of depth selective analysis with gaseous proportional counters. (author).

45998 (INIS-SU–100, pp. 24-28) **Precision measurements of the conversion lines intensities by a modernized β-spectrometer UMB-1.** Davidonis, R.J.; Zhirgulevichius, R.K.; Kalinauskas, R. and others. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The UMB-1 beta-spectrometer measurements are performed using a 20-band source and a 16-channel microchannel plate electron detector. To control the spectrometer and to store, process and output information an automated device based on DVK-2 and CAMAC-crate interactive computer complex with appropriate functional modules is developed. Brief performances of the device and the possibilities of control and initial result processing programs are presented. The examples of measuring ^{109}Cd ICE spectra with 0.04-0.05% resolution with the statistic precision, of determining the intensity of conversion lines of about 1%, are given. The measurement of ICC relations with different theoretical relations is compared. 11 refs.; 2 figs.; 1 tab.

45999 (IPEN-PUB–243) **Least square methods and covariance matrix applied to the relative efficiency calibration of a Ge(LI) detector.** Geraldo, L.P.; Smith, D.L. Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). Jan 1989. 32p. Order Number DE89636486/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The methodology of covariance matrix and square methods have been applied in the relative efficiency calibration for a Ge(Li) detector apllied in the relative efficiency calibration for a Ge(Li) detector. Procedures employed to generate, manipulate and test covariance matrices which serve to properly represent uncertainties of experimental data are discussed. Calibration data fitting using least square methods has been performed for a particular experimental data set. (author).

46000 (KEK–88-10, pp. 322-329) **Results from VENUS.** Yamada, Yoshikazu (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The VENUS detector is a general purpose magnetic detector. The central drift chamber is placed in magnetic filed of 7.5 kG and has a coverage of 30deg$\leq\theta\leq$150deg with momentum resolution of σ_p/P = 0.008 P_t (GeV/c). The barrel lead glass calorimeter has a coverage of 37deg$\leq\theta\leq$143deg with energy resolution of σ_E/E = 3.7% for electrons of 26GeV. The end cap liquid argon calorimeter has a coverage of 8deg$\leq\theta\leq$38deg and 142deg$\leq\theta\leq$172deg with resolution of σ_E/E = 3.5% for electrons of 26GeV. The TOF counter system has a coverage of 35deg$\leq\theta\leq$145deg with time resolution of 220 psec. The barrel part of muon chamber has a coverage of 62% of 4π. VENUS has accumulated data of 11 pb^{-1} between $\sqrt{s}$ = 50GeV and = 56GeV. The lower-limits of the QED cutoff parameters for e^+e^-->e^+e^- and $\gamma\gamma$ were obtained as 164GeV(Λ_+), 218GeV(Λ_-) and 80GeV(Λ_+), 76GeV(Λ_-), respectively. The forward-backward charge symmetries for μ-pair and μ-pair production were obtained as -0.32+-0.07 and -0.20+-0.11, all of which agree well with theoretical predictions. The production of the sequential heavy lepton was excluded for $m_L\leq$27.5GeV/c^2 both for stable and unstable case. The measured R ratio R = 4.78+-0.22+-0.21 at $\sqrt{s}$ = 56GeV was consistent with the prediciton of the standard model with 5 flavors. The shape analysis of the hadronic events excluded the production of the open top quark. No anomaly was found in the hadronic events with isolated leptons in low thrust region. (N.K.).

46001 (N–89-23399) **Observational techniques for solar flare gamma-rays, hard X-rays, and neutrons. Final report, 1 November 1983-30 November 1988.** Lin, R.P. California Univ., Berkeley, CA (USA). Apr 1989. 62p. (NASA-CR–184910;NAS–1.26:184910). Available from NTIS, PC A04/MF A01.

The development of new instrumentation and techniques for solar hard X-ray, gamma ray and neutron observations from spacecraft and/or balloon-borne platforms is examined. The principal accomplishments are: (1) the development of a two segment germanium detector which is near ideal for solar hard X-ray and gamma ray spectroscopy; (2) the development of long duration balloon flight techniques and associated instrumentation; and (3) the development of innovative new position sensitive detectors for hard X-ray and gamma rays.

46002 (NUREG/CP–0098-Vol.2, pp. 1099-1108) **Newly designed anticoincidence proportional counter for measuring ^{85}Kr in environmental air samples.** Jiunn-Guang, Lo (National Tsing Hua Univ., Taiwan (China)); Huanshu, Lin. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

An anticoincidence proportional counter has been developed for measuring low level ^{85}Kr in environmental air samples. The minimum detection activity is 5.2 pCi and the counting efficiency is 5.78% based on the 687 keV β energy of ^{85}Kr. A portable sampling system is also set up for the collection, separation and purification of ^{85}Kr from air samples. The mean recovery yield of this system is 91.6%. The lower limit of detection of this counting system including sampling is 9.6 pCi m^{-3}. This improved system is very suitable for monitoring ultra-low level ^{85}Kr in environmental air samples taken from a transistor factory, where ^{85}Kr is used for quality control of products. A computer program of an atmospheric diffusion model is also provided to estimate the distribution of ^{85}Kr concentration in air of the transistor factory. The highest ^{85}Kr concentration is estimated to be ~100 pCi m^{-3}.

46003 (SLAC-PUB–5002) **A review of 4π Čerenkov ring imaging detectors.** Leith, D.W.G.S. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8904267–2: Symposium on particle identification at high luminosity hadron colliders, 5-7 Apr 1989). Order Number DE89015630/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The design choices for 4π ring imaging Čerenkov counters – both those of principle and those of practice – are reviewed. The progress in construction and the performance of the devices being built for DELPHI and SLD are discussed. 13 refs., 22 figs.

46004 (SLAC-PUB–5016) **Survey of the response of standard limited streamer tubes over the complete range of three-component gas mixtures of isobutane, CO_2, argon.** Calcaterra, A.; De Sangro, R.; De Simone, P.; Burrows, P.; Cartwright, S.L.; Gonzalez, S.; Lath, A.; Schneekloth, U.; Williams, D.C.; Yamartino, J.M. SLD-WIC Collaboration. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515;AC02-76ER03069;AC02-76ER00881. (CONF-8905194–4: 4. Pisa meeting on advanced detectors: frontier detectors from frontier physics, 21-26 May 1989). Order Number DE89016692/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We present the results of a systematic study of three-component gas mixtures containing argon, isobutane, and carbon dioxide. The study used production-type chambers from the SLD Warm Iron Calorimeter (WIC), instrumented with standard pleastic streamert tubes, and triggered by cosmic-ray muons. Pulse height spectra are presented as a function of high voltage, over a wide range of mixtures of these three gases. Various features and similarities observed throughout this three-dimensional mixture space are important clues to understanding the underlying physics of discharge mechanisms in wire detectors. 15 refs., 17 figs.

46005 (SLAC-PUB–5040) **Design considerations for a Čerenkov ring imaging detector at the tau-charm factory.** Ratcliff, B.N. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–10: Tau-Charm workshop, 23-27 May 1989). Order Number DE89016945/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A schematic design of a Čerenkov ring imaging detector for use at a τ-charm factory is described. The performance of this device and its implications for the other parts of the spectrometer are discussed. 11 refs., 4 figs.

46006 (SLAC-PUB–5042) **Data acquisition and online processing requirements for experimentation at the Superconducting Super Collider.** Lankford, A.J.; Barsotti, E.; Gaines, I. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905194–5: 4. Pisa meeting on advanced detectors: frontier detectors from frontier physics, 21-26 May 1989). Order Number DE89016946/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Differences in scale between data acquisition and online processing requirements for detectors at the Superconducting Super Collider and systems for existing large detectors will require new architectures and technological advances in these systems. Emerging technologies will be employed for data transfer, processing, and recording. 9 refs., 3 figs.

46007 Fast neutron detection using a new pulse shape discrimination technique: Charge sensitive integration. Zucker, M. (Brookhaven National Lab., Upton, NY (USA)); Tsoupas, N.; Karwowski, H.; Castaneda, C.; Nimnual, S.; Porter, R.; Ward, T. pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809278–: American Chemical

Society Division of Nuclear Chemistry and Technology, 25-30 Sep 1988).

A new electronic technique that depends on charge sensitive integration (CSI) has been developed and tested using a CAMAC based pulse shape discrimination system. Neutrons are well separated from γ-ray signals in the 0.1-100 MeV energy range. The new method was compared with the old zero-crossing time-to-amplitude differentiating technique and was found to be comparable in count rate and superior in noise suppression.

46008 Theoretical studies of hadronic calorimetry for high luminosity, high energy colliders. Brau, J.E. (Oregon Univ., Eugene (USA)); Gabriel, T.A. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(1/2): 40-56 (1 Jul 1989). (CONF-8806235–: International conference on advanced technology and particle physics, 12-17 Jun 1988).

Experiments at the high luminosity, high energy colliders of the future will require optimization of the state of the art of calorimetry design and construction. During the past few years, the understanding of the basic phenomenology of hadron calorimeters has advanced through parallel theoretical and experimental investigations. The important underlying processes are reviewed to set the framework for the presentation of recent calculations of the expected performance of silicon detector based hadron calorimeters. Such devices employing uranium are expected to achieve the compensation condition (that is, e/h$\simeq$1.0) based on the understanding that has been derived from the uranium-liquid argon and uranium-plastic scintillator systems. In fact, even lead-silicon calorimeters are found to achieve the attractive value for the e/h ratio of 1.16 at 10 GeV. (orig.).

46009 The zero-degree calorimeter for the relativistic heavy-ion experiment WA80 at CERN. Young, G.R. (Oak Ridge National Lab., TN (USA)); Awes, T.C.; Baktash, C.; Cumby, R.P.; Ferguson, R.L.; Gabriel, T.A.; Johnson, J.W.; Lee, I.Y.; Obenshain, F.E.; Plasil, F. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(3): 503-517 (15 Jul 1989). DOE Contract AC05-84OR21400.

Calibration and performance results are presented for a sampling calorimeter designed for use as a beam calorimeter at zero degrees in the relativistic heavy-ion experiment WA80 at CERN. This uranium-scintillator zero-degree calorimeter (ZDC) was found to have a linear response to heavy ions over the range 60-6400 GeV and an in-beam hadronic resolution ranging from $\sigma/E = 0.013+0.33/\sqrt{E}$ at low intensities to $\sigma/E = 0.02+0.67/\sqrt{E}$ at higher intensities. The e/h ratio of the electromagnetic section was measured to be 1.12 at 135 GeV. The ZDC operated reliably with incident beams of 3.2 TeV oxygen and 6.4 TeV sulfur at intensities of over 10^6 nuclei per spill. It provided a trigger both for minimum bias events and for violent central collisions. (orig.).

46010 (CONF-890736–64) **3-D heat transfer computer calculations of the performance of the IAEA's air-bath calorimeters.** Elias, E.; Kaizermann, S.; Perry, R.B.; Fiarman, S. Argonne National Lab., IL (USA). 1989. 6p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract W-31109-ENG-38. From 30. annual meeting of the Institute of Nuclear Materials Management; 9-12 Jul 1989. Order Number DE89016908/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A three dimensional (3-D) heat transfer computer code was developed to study and optimize the design parameters and to better understand the performance characteristics of the IAEA's air-bath calorimeters. The computer model accounts for heat conduction and radiation in the complex materials of the calorimeter and for heat convection and radiation at its outer surface. The temperature servo controller is modelled as an integral part of the heat balance equations in the system. The model predictions will be validated against test data using the ANL bulk calorimeter. 11 refs., 6 figs.

46011 (CONF-890902–7) **Real-time observations of aerosol composition changes.** Johnson, S.A.; Kumar, R. Argonne National Lab., IL (USA). [1989]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From 198. American Chemical Society national meeting; 10-15 Sep 1989. Order Number DE89012382/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have developed a near real-time aerosol particle analyzer that uses a combination of filtration and impaction for particle size classification and collection, and Fourier-transform infrared (FTIR) spectroscopy for analysis. This infrared aerosol analyzer (IAA) supplies full range (2.0–20 μm) infrared absorption spectra of the ambient aerosol separated into three different size fractions. The coarse size fraction, >2.5 μm aerodynamic diameter (a.d.), made up largely of crustal matter, is analyzed separately from the fine (0.5–2.5 μm a.d.) and the ultra-fine (<0.5 μm a.d.) size fractions which contain the secondary particulate matter that is formed in the atmosphere from gaseous and condensed-phase precursors. Separating the three size fractions avoids interactions between the possibly acidic fine fractions and the possibly basic coarse fraction. The collected particulate samples are analyzed in situ by infrared spectroscopy with analytical time resolutions approaching those of trace gas analyzers. 5 refs., 8 figs.

46012 (CONF-890996–2) **Using self-calibrating thermocouples in industry.** Ruppel, F.R. Oak Ridge National Lab., TN (USA). 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Sensor's expo '89; 12-14 Sep 1989. Order Number DE89013539/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The self-calibrating thermocouple is a thermocouple with a low melting point, high-purity metal encapsulated near but metallurgically isolated from its thermojunction. It is designed to provide a single-point calibration of the thermocouple at the melting point of the encapsulated metal because the time-temperature curve of the thermocouple will plateau at this temperature during heating or cooling. The calibration procedure consists of comparing the plateau temperature with the known melting point temperature of the encapsulated metal. The difference between these two values is the thermocouple error at the calibration point. The device is commercially available, but to be effective in industry it must be augmented with a data acquisition system with an algorithm that will automatically report the calibration error. 5 refs., 7 figs.

46013 (CONF-890996–4) **Optical pyrometer temperature measurement in metal-casting operations.** Lind, R.F.; Mee, D.K. Oak Ridge National Lab., TN (USA). 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Sensor's expo '89; 12-14 Sep 1989. Order Number DE89014754/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Oak Ridge Y-12 Plant in Oak Ridge, Tennessee, produces a variety of weapons-related components for the US Department of Defense. In recent years the Y-12 Plant has been undergoing renovations and process improvements as part of an overall modernization effort. Part of this work includes the automation of temperature control in a number of metal-casting operations. This paper relates the experience of implementing an automatic temperature measurement system for the metal casters, especially the two-color optical pyrometers eventually selected as the primary temperature sensor. 2 refs., 2 figs., 1 tab.

46014 Sub-nanosecond, photon counting, imaging, x-ray camera. Whelan, D.A. (Lawrence Livermore National Lab., CA (USA)); Carter, M.R.; Price, D.F.; Steward, R.E. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). DOE Contract W-7405-ENG-48. From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

A high temporal bandwidth x-ray detector has been developed for time resolved one dimensional x-ray imaging experiments. The detector serves as a high gain, high quantum efficiency preamplifier for a streak camera, and consists of a reflective x-ray photocathode, an active microchannel plate, optional electrostatic optics, and a sub-nanosecond phosphor. The optional electrostatic optics allows the detector to be used for either two dimensional imaging with a 100 picosecond framing (without focusing optics), or as a high gain one dimensional imaging detector, with either a 100 picosecond gated Reticon camera, or a streak camera. Other versions of the one dimensional detector have been developed, in which the microchannel plate which employs a reflective photocathode on the front surface of the microchannel plate, is replaced with a transmission photocathode consisting of a photocathode deposited on a thin polypropylene foil. The detector exhibits a time resolution of 400 picoseconds FWHM, a spatial resolution of 350 μm with an electron compression of ten to one (100μm resolution without compression). Quantum efficiency of 40% have been achieved, and 100% have been achieved with the one dimensional electrostatic optics. Data will be presented on the efficiency, time response and spatial resolution of the one dimensional detectors. 4 refs., 9 figs.

46015 (DOE/ER/40319–T1) **Fiber tower calorimeter continuation proposal and status report.** Walker, J.K.; White, A.P.; Wahl, H. Florida State Univ., Tallahassee, FL (USA). 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-87ER40319. Order Number DE89016661/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In November 1988 our "Proposal to Build a New High Resolution Fiber Tower Calorimeter" was approved by DOE/SSC Division. The present document is a continuation proposal and status report for the FSU portion of this project.

46016 (EGG–10617-6055) **Fiber optics: A brief introduction.** Gruchalla, M.E. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1989. 14p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC08-88NV10617. (CONF-890996–1: Sensor's expo '89, 12-14 Sep 1989). Order Number DE89009337/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

A basic introduction into the principles of fiber optics is presented. A review of both the underlying physical principles and the individual elements of typical fiber-optic systems are presented. The optical phenomenon of total internal reflection is reviewed. The basic construction of the optical fiber is presented. Both step-index and graded-index fiber designs are reviewed. Multimode and single-mode fiber constructions are considered and typical performance parameters given. Typical optical-fiber bandwidth and loss characteristics are compared to various common coaxial cables, waveguides, and air transmission. The constructions of optical-fiber cables are reviewed. Both loose-tube and tightly-buffered designs are considered. Several optical connection approaches are presented. Photographs of several representative optical connectors are included. Light Emitting Diode and Laser Diode emitters for fiber-optic applications are reviewed, and some advantages and shortcomings of each are considered. The phenomenon of modal noise is briefly explained. Both PIN and Avalanche photodetectors are reviewed and their performance parameters compared. Methods of data transmission over optical fiber are introduced. Principles of Wavelength, Frequency, and Time Division Multiplexing are briefly presented. The technology of fiber-optic sensors is briefly reviewed with basic principles introduced. The performance of a fiber-optic strain sensor is included as a practical example. 7 refs., 10 figs.

46017 (EGG-M–14487) **Proposed recoil mass spectrometer for heavy ion reactions.** Cole, J.D.; Cormier, T.M.; Hamilton, J.H.; Ramayya, A.V. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1987. 5p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570;AS05-76ER05034. (CONF-870970–19: 5. international conference on nuclei far from stability, 14-19 Sep 1987). Order Number DE89010981/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A proposed recoil mass spectrometer of high rigidity, large solid angle acceptance, and good mass resolution for use with the HHIRF accelerators at ORNL is described. 5 refs., 3 figs., 1 tab.

46018 (Juel–2254) **Examination of the suitability of noise thermometry for precise in situ calibration of thermocouples in technical processes. Verification of the achievable accuracy at fixed points.** Fechner, H. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentrallabor fuer Elektronik; Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Technische Hochschule Aachen (Germany, F.R.). Dec 1988. 197p. (In German). Order Number DE89914976/JAW. Available from NTIS (US Sales Only), PC A09/MF A01.

The aim was to determine the achievable accuracy of the noise thermometer developed at the KFA in the range from 0 to 1000^{0}C under laboratory conditions. Precision noise temperature measurements at fixed temperature points (triple point of water, freezing point of zinc and silver) were carried out. The fixed point technique and the conventional precision resistance thermometry, which is required to operate the fixed points, were established in accordance with the requirements of accurate (and thus longer lasting) noise temperature measurements. The analysis of all possible sources of error ensured that all systematic or random errors were in the range of a few 10^{-5}. The further developed KFA noise thermometers, which can be used under industrial conditions, achieve under laboratory conditions a measuring error of about +-2.5 10^{-4} - relative to the thermodynamic temperature scale - in the temperature range from 273.16 K (0.01^{0}C) to 1234.894 K (961.744^{0}C). Assuming that the individual measured values display a normal distribution, the noise measurements at the zinc and silver point are combined to a mean value, it becomes apparent that the average noise temperatures only deviate by +2 10^{-5} (zinc) or +4 10^{-5} (silver) from the respective thermodynamic temperature. (orig./HP).

46019 (LA-UR–89-2112) **Multimode fiber interferometry and several-mode fiber polarimetry via phase conjugation.** Forman, P.R.; Jahoda, F.C.; Mason, B.L.; Netterfield, C.B. Los Alamos National Lab., NM (USA). 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8909161–1: 6. international conference on optical fiber sensors, 17-20 Sep 1989). Order Number DE89014226/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

While the simplest fiber optics are realized by transmission intensity modulations impressed on multimode fibers, great enhancements in sensitivity are achieved by interferometric or polarimetric methods with light propagated through single-mode fibers. In this paper we report preliminary experiments on retaining the sensitivity of interferometric and/or polarimetric measurements while using only multimode fiber components. The utility of success in this endeavor can be measured by greater experimental simplicity (light injection and alignment tolerances), by cost factors (cheaper fiber optics components), or by larger intensity transmission limits (which can be translated to higher time resolution for a given signal-to-noise ratio). 14 refs., 3 figs.

46020 (LBL–26734) **Atomic imaging and interfacial analysis.** Hetherington, C.J.D.; Thomas, G. Lawrence Berkeley Lab., CA (USA). Jan 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8901153–1: Ceramics-metal interfaces conference, 16-18 Jan 1989). Order Number DE89015339/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The structure and composition of interfaces are important in influencing the overall physical properties of materials. Thus, a methodical development of the growth and processing of metal/ceramic composites with a view to improving their properties should be accompanied by a characterization of the interfacial structures. In this paper, the contribution of atomic imaging by electron microscopy to such an analysis is indicated with examples of research utilizing the Atomic Resolution Microscope (ARM) at the National Center for Electron Microscopy. 10 refs., 1 fig.

46021 (NRC–27703) **The Pt/Au thermocouple.** MacLaren, E.H.; Murdock, E.G. National Research Council of Canada, Ottawa, ON (Canada). 1987. 117p. (MICROLOG–89-03296). Available from National Research Council of Canada, Publication Sales and Distribution Office, Montreal Road, Ottawa, ON, CAN K1A 0R6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In the first part of this study the essential thermoelectric performance, following a recommended preparatory heat treatment, of the Pt/Au thermocouple was examined at the ice point and at the freezing and melting temperatures of high purity metals. Direct comparisons at high precision of the immersion thermoelectromotive force characteristics of the Pt/Au and Pt/Pt10Rh thermocouples at the metal fixed points are presented and critical assessments of the merits of these thermocouples for temperature measurements in the 0-1000^{0}C range are drawn. The stress-relieved Pt/Au couple clearly outclasses the Pt/Pt10Rh couple in thermoelectric stability, homogeneity and sensitivity and even challenges the high temperature platinuim resistance thermometer on the basis of simplicity and economic practicality. The Pt/Au couple, therefore, merits serious consideration as an alternative but preferred temperature sensor for many, if not most, precise (+- 0.0^{0}C) temperature measurements in the 0-1000^{0}C range. The second part of the study describes the investigations on the effects of heat treatments at 450-1000^0 C on the thermoelectric stability and homogeneity of high purity Au wire that led to the preferred preparatory anneal which underlies the superior performance of Pt/Au thermocouples as described in the first part. Comparisons of the thermoelectric effects of up to 100 h heat treatments at uniform temperatures on wires from a single refined batch, from different batches from a single refiner, and from batches produced by different refiners are presented. An overview is given of the variations that may be expected in selecting wire for Pt/Au thermocouples. 47 refs., 30 figs., 9 tabs.

46022 (NRC–29808) **Fuel flow measurement in gas turbine testing.** Garbe, W. National Research Council of Canada, Ottawa, ON (Canada). 1988. 54p. (MICROLOG–89-03256). Available from National Research Council of Canada, Publication Sales and Distribution Office, Montreal Road, Ottawa, ON, CAN K1A 0R6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The accurate measurement of fuel flow constitutes an important part of gas turbine performance assessment. Prompted by an international turbine performance evaluation, the Engine Laboratory of the National Research Council of Canada has critically examined the existing fuel flow measuring methods. The report describes documentation wherever possible. Since the laboratory employs turbine flowmeters exclusively, the discourse has been limited to that type offlow establishment. Together with an in-house ballistic flowmeter system, the present Engine Laboratory fuel flow measuring system provides gas turbine fuel flow assessment of known accuracy. An error analysis, for normal operating conditions, indicated an uncertainty in corrected fuel flow of +_0.75%. Recommendations have been made for improvements in some measurement components. 16 refs., 8 figs., 1 tab.

46023 (OH/RD–88-41-K) **Evaluation of the environmental instruments wind and temperature probe in a wind tunnel and environmental chamber.** Tam, Y.T. Ontario Hydro Research Div., Toronto, ON (Canada). 1988. 20p. (MICROLOG–89-02612). Available from Ontario Hydro Research Division, Records Clerk, Bldg. KR 107, 800 Kipling Ave., Etobicoke, ON, CAN M8Z 5S4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The operational usefulness of a recently acquired wind, temperature and relative humidi ty probe was investigated in a wind tunnel facility, and an environmental chamber at Ontario Hydro Research Division. Results from the tests indicate that the probe generally performs satisfactorily. However, the wind speed response is slightly low when the wind is from 360 degrees. A slight underestimation is also observed when the wind is from 225 degrees and below about 8 m/s. This under-estimation is thought to be attributable to the configuration of the probe itself. Temperature and relative humidity measurements made with the probe agreed very well with experimentally set values. 4 figs., 12 tabs.

46024 (UCRL–100242) **Maximization of directed electromagnetic radiation with an optimized antenna.** Bevensee, R.M. Lawrence Livermore National Lab., CA (USA). Jun 1989. 5p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. (CONF-8908101–1: International Union of Radio Science international symposium on electromagnetic theory, 14-17 Aug 1989). Order Number DE89014045/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We summarize the results of a study to obtain reasonable upperbounds to the maximum energy density $W_T(\Omega_0)$ per steradian radiated during a time interval $(-T,T)$ in a direction Ω_0 and also the maximum instantaneous far-field $|rE(\Omega_0)|$. The constraints are (1) the antenna elements are driven in series by a circuit of zero stored energy around a simple series resonance, (2) the antenna is enclosed within a spherical working volume of radius $a/\lambda_{min} = 1$, (3) signal frequencies are restricted to $\omega \leq \omega_{max} = 2\pi c/\lambda_{min}$, (4) the total energy radiated is 1 J. 6 refs., 3 figs.

46025 Torsional piezoelectric crystal viscometer for compressed gases and liquids. Diller, D.E. (National Institute of Standards and Technology, Boulder, CO (USA)); Frederick, N.V. *International Journal of Thermophysics (USA),* 10(1): 145-157 (Jan 1989). (CONF-880606–: 10. symposium on thermophysical properties, 20-23 Jun 1988).

A torsional piezoelectric crystal viscometer for compressed gases and liquids at temperatures to 600 K and a pressures to 70 MPa has been developed. Several torsional crystals were prepared from swept (electrolyzed) quartz to obtain a good performance at high temperatures. Measurements of the bandwidth of the crystal resonance curve were automated using an impedance analyzer. The viscometer was tested on compressed gaseous argon and methane at temperatures to 500 K and at pressures to 50 MPa. The measurements differ from accurate wide-range correlating equations by less than 2%.

46026 Container for heat treating materials in microwave ovens. Holcombe, C.E.; Dykes, N.L.; Kimrey, H.D. Jr.; Mills, J.E. To Dept. of Energy, Washington, DC. USA Patent 4,810,846. 7 Mar 1989. Filed date 26 Jan 1988. vp. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

The efficiency of a microwave oven of a conventional two-source configuration and energy level is increased by providing the oven with a container for housing a refractory material to be treated. The container is formed of top and bottom walls transparent to microwaves while the sidewalls, in a circular configuration, are formed of a nonmetallic material opaque to microwave radiation reflecting the radiation penetrating the top and bottom walls radially inwardly into the center of the container wherein a casket of heat-insulating material is provided for housing the material to be heat treated. The reflection of the microwave radiation from the sidewalls increases the concentration of the microwaves upon the material being heat treated while the casket retains the heat to permit the heating of the material to a substantially higher temperature than achieveable in the oven without the container.

46027 (LA-UR–88-3161) **NTO development at Los Alamos.** Chapman, L. Los Alamos National Lab., NM (USA). 1989. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890926–1: 9. international symposium on detonation, Sep 1989). Order Number DE89000356/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

NTO is an explosive with calculated performance near that of RDX but with sensitivity approaching that of TATB. Possible uses for NTO would be as an alternative to RDX in formulations where a lower sensitivity is desired or as an alternative to TATB where more performance is required without a large increase in sensitivity. Efforts have been concentrated on producing NTO and in testing the performance and sensitivity of NTO and NTO formulations. One-hundred pounds of NTO have been produced and some performance and sensitivity data have been obtained. Work is being

done to determine the diameter effect for large-crystal-size NTO. Additional work is being done to improve the small-charge diameter performance of NTO by adding small amounts of RDX or by changing the crystal size and/or crystal habit of the NTO. 1 fig., 3 tabs.

46028 (LA-UR–89-376) **Free-expansion experiments and modeling in detonation: Chemistry and hydrodynamics on a laboratory scale.** Greiner, N.R.; Blais, N. Los Alamos National Lab., NM (USA). 1989. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890811–19: 9. international symposium on detonation, 28 Aug - 1 sep 1989). Order Number DE89007748/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Laboratory-scale (25-50 mg) detonations of PETN, RDX, HNS, and TNT have been carried out in a high-vacuum chamber, and collisionless molecular beams of the freely expanding detonation products have been analyzed as a function of time with a mass spectrometer. Concurrently, time-sequenced schlieren and shadowgraph images of the initial expansion of the product plume are recorded using a pulsed laser for illumination. These data tie the chemistry and hydrodynamics of the detonation event together. The results, interpreted with the aid of a computer model, suggest that this experiment freezes the chemical reactions of detonation by rapid adiabatic cooling and provides a continuum of samples in the molecular beam, representing the sequence of reactions in the detonating charge. With a suitable model of the expansion hydrodynamics, the hydrodynamic histories of a sequence of volume elements can be associated with their frozen chemistries. We expect experiments like this to provide a test for molecular models of detonation. 10 refs., 5 figs.

46029 (LA-UR–89-407) **Effects of binder concentration on the properties of plastic-bonded explosives.** Steele, R.D.; Stretz, L.A.; Taylor, G.W.; Rivera, T. Los Alamos National Lab., NM (USA). [1989]. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890811–18: 9. international symposium on detonation, 28 Aug - 1 sep 1989). Order Number DE89007744/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A series of plastic-bonded explosives (PBX) has been formulated with more binder than is normally contained in high-energy formulations. Adding a relatively small amount of binder to a material such as PBX 9501 [95/2.5/1.25/1.25 wt % HMX/Estane/BDNPA/BDNPF (the BDNPA and BDNPF form a eutectic that is frequently called simply the eutectic)] was found to decrease the shock sensitivity while not decreasing the energy of the explosive. The best compromise for a PBX 9501-type material contains about 92 wt % HMX. Adding additional binder does not continue to decrease the gap sensitivity of the formulation; however, the energy of the PBX decreases as expected. The higher-binder formulations are of potential use because of the possibility of formulating a PBX with energy similar to TATB formulations, such as PBX 9502 (95/5 wt % TATB/Kel-F 800), and with a higher strain to failure. 2 refs., 4 figs., 1 tab.

46030 (LA-UR–89-602) **In-situ study of the chemically driven flow fields in initiating homogeneous and heterogeneous nitromethane explosives.** Sheffield, S.A.; Engelke, R.; Alcon, R.R. Los Alamos National Lab., NM (USA). 1989. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890811–8: 9. international symposium on detonation, 28 Aug - 1 sep 1989). Order Number DE89008415/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Electromagnetic gauging has been used to make in-situ measurements of particle velocity and impulse at five Lagrangian positions in nitromethane (NM) during gas-gun-driven, shock-to-detonation experiments. Homogeneous initiation experiments were conducted using NM that was chemically sensitized (using an organic base) and heterogeneous initiation experiments were done with physically sensitized NM (using silica particles). In the homogeneous initiation experiments, some of the features we observed are consistent with the classical homogeneous initiation model, however, our measurements show that the superdetonation does not form immediately after an induction time. Considerably behind the initial shock, reaction causes a wave to build up over a discernible length and this wave evolves into a superdetonation which catches the initial shock. In the heterogeneous initiation experiments, the waveforms indicated that wave growth occurs primarily in the shock front, similar to earlier observations in other heterogeneous explosives. 21 refs., 8 figs., 3 tabs.

46031 (LA-UR–89-2716) **Crystal orientation effects in PETN explosive with 4 GPa shocks.** Dick, J.J.; Pettit, D.R.; Spencer, W.J. Los Alamos National Lab., NM (USA). 1989. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890812–32: American Physical Society topical conference on shock compression of condensed matter, 14-17 Aug 1989). Order Number DE89016996/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Shock initiation of detonation has been observed in PETN crystals of ⟨110⟩ orientation at the low shock strength of 4.25 GPa. This result explains some observations by other workers at Los Alamos National Laboratory that were considered anomalous. Chemiluminescent emission from the shock-induced decomposition reactions has been observed using OMA spectrographs, photodiodes, and image intensifier cameras. The emission is not seen in the insensitive orientations, ⟨100⟩ and ⟨101⟩; these orientations can deform using the primary slip plane, ⟨110⟩. 4 refs.

46032 (LA-UR–89-2723) **Laser-driven miniature flyer plates for shock initiation of secondary explosives.** Paisley, D.L. Los Alamos National Lab., NM (USA). 1989. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890812–21: American Physical Society topical conference on shock compression of condensed matter, 14-17 Aug 1989). Order Number DE89016587/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Miniature flyer plates (<1-mm diameter X <5-micron thick) of aluminum and other materials are accelerated by a 10-ns pulsed Nd:YAG laser to velocities >5 km/s. Velocity profiles are recorded by velocity interferometry (VISAR) techniques and impact planarity by electronic streak photography. Techniques for improving energy coupling from laser to flyer plate will be discussed. Flyer plate performance parameters will be compared with material properties. The $P^n t$ criteria for shock initiation of explosives will be compared for various flyer materials, pressure, and pulse duration. Performance of secondary explosives (PETN, HNS, HMX, various PBX, others) will be reported. These data will detail the experimental effect of t (in $P^n t$) approaching values of a few nanoseconds. 9 refs., 5 figs.

46033 (LA-UR–89-2734) **Preliminary report confined tension testing of 900-24.** Harlow, R.A.; Browning, R.V. Los Alamos National Lab., NM (USA). 10 Sep 1988. 24p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908128–1: Western Regional Strain Gage Committee meeting, 22 Aug 1989). Order Number DE89016595/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A specially designed confining pressure vessel is described that allows tensile samples to be tested under a superimposed confining hydrostatic pressure. Tests on samples of well characterized materials such as aluminum were used to verify the operation of the system, calibration of the internal load cell, and data reduction methods. The results of a series of exploratory tests done on the inert material 900-24 are described. 4 refs., 17 figs., 2 tabs.

46034 (LA-UR–89-2791) **Sharp shock model for propagating detonation waves.** Bukiet, B.; Menikoff, R. Los Alamos National Lab., NM (USA). 1989. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890812–38: American Physical Society topical conference on shock compression of condensed matter, 14-17 Aug 1989). Order Number DE89016772/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Recent analyses of the reactive Euler equations have led to an understanding of the effect of curvature on an underdriven detonation wave. This advance can be incorporated into an improved sharp shock model for propagating detonation waves in hydrodynamic calculations. We illustrate the model with two simple examples: time dependent propagation of a diverging detonation wave in 1-D, and the steady 2-D propagation of a detonation wave in a rate stick. Incorporating this model into a 2-D front tracking code is discussed. 20 refs., 3 figs.

46035 (SAND–88-2385C) **A shock initiation model for fine-grained hexanitrostilbene.** Kipp, M.E.; Setchell, R.E. Sandia National Labs., Albuquerque, NM (USA). 1989. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890811–5: 9. international symposium on detonation, 28 Aug - 1 sep 1989). Order Number DE89007641/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An established body of data indicates that very fine-grained hexanitrostilbene (HNS), when pressed to 92% of crystal density, exhibits shock initiation characteristics unlike those typical of porous, granular explosives. That is, a progressive buildup towards detonation from an initial shock by hot spot formation and growth processes is not observed. Instead, this particular HNS exhibits shock initiation characteristics normally associated with homogeneous explosives (e.g., the formation of a superdetonation wave after an initial shock has been introduced). In the present work, a comprehensive effort has been made to develop a predictive model for shock initiation in this material. This model is based on a theory of homogeneous reactive mixtures, and includes a refined equation of state for porous HNS reactant and a JWL equation of state for gaseous reaction products. The model has been incorporated into wave propagation codes, and comparisons with available initiation data are made. 22 refs., 8 figs.

46036 (SAND–88-2465C) **Laser initiation of secondary explosives: Renlund paper No. 115.** Renlund, A.M.; Stanton, P.L.; Trott, W.M. Sandia National Labs., Albuquerque, NM (USA). [1989]. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890926–2: 9. international symposium on detonation, Sep 1989). Order Number DE89010229/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

Several experiments were performed to investigate the effects of explosive material parameters on energy thresholds for direct laser initiation of secondary explosives. Laser energy requirements for initiation of pentaerythritol tetranitrate (PETN) were decreased for small particle size powder and low density pressings. Promptness of detonation, however, was aided by higher densities. Initiation of PETN was achieved at energies at or below 10 mJ (power densities ~0.2 GW cm^{-2}) at laser wavelengths of 1.06 μm, 532 nm and 355 nm and strong confinement of the explosive sample assisted build-up to detonation. At 355 and 308 nm PETN could be initiated by irradiation on the bare explosive surface. Hexahydro-1,3,5-trinitro-s-triazine (RDX) was initiated at 308 nm but not at 1.06 μm. Hexanitrostibene (HNS) by direct irradiation at any of these wavelengths was successful. The results suggest that if sufficient energy is deposited, a fast deflagration or convective burn is achieved and that this grows to detonation via a conventional deflagration-to-detonation transition (DDT). 14 refs., 6 figs., 2 tabs.

46037 (SAND–88-2618C) **Time-resolved mass spectrometry technique for studying fast transient CHNO explosive decomposition kinetics.** Skocypec, R.D.; Erickson, K.L. Sandia National Labs., Albuquerque, NM (USA). 1989. 21p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890811–27: 9. international symposium on detonation, 28 Aug - 1 sep 1989). Order Number DE89016540/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An experimental system is being developed to study the fast transient kinetics governing solid-phase decomposition and subsequent interaction with decomposition products. The first phase of this work addresses the decomposition step. The experiment integrates a thin-film sample configuration with two chemical diagnostic techniques, time-of-flight mass spectrometry and time-resolved infrared spectral photography, and a pulsed-laser heat source. The experiment has microsecond temporal resolution to examine both condensed-phase mechanisms and concurrent gas-phase species evolution from samples at temperatures up to 1000°C. Experiments are underway to demonstrate and assess the use of thin-film samples with the experimental system. Results of these experiments, the diagnostic capabilities of the experimental system, and the advantages, preparation and characterization of thin-film samples are presented. 16 refs., 10 figs.

46038 (SAND–88-2766C) **Shock behavior of explosives about the c-j [Chapman-Juget] point.** Cooper, P.W. Sandia National Labs., Albuquerque, NM (USA). 1989. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890811–6: 9. international symposium on detonation, 28 Aug - 1 sep 1989). Order Number DE89007642/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Experimental data for pressure and particle velocity along the Hugoniot of detonation reaction products for a number of explosives are correlated in a reduced parameter form P/P_{cj} versus u/u_{cj}. Two correlations are found: $P/P_{cj} = a + b(u/u_{cj}) + c(u/u_{cj})^2$ when $P/P_{cj} > 0.08$, and $P/P_{cj} = m(u/u_{cj})^n$ when $P/P_{cj} < 0.08$. The correlations yield results that agree reasonably with code calculations. 13 refs., 3 figs., 1 tab.

46039 (SAND–89-0320C) **Estimation of the C-J pressure of explosives.** Cooper, P.W. Sandia National Labs., Albuquerque, NM (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909113–2: 14. international pyrotechnics seminar, 18-22 Sep 1989). Order Number DE89013811/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The correlation of a broad experimental data base yields a power function relationship between ρ_{cj} and ρ_0. Combining this function with the Rankine-Hugoniot equations for mass and momentum, an equation can be derived to estimate simply and accurately (within an average error of 5.7%) the value of P_{cj}, when ρ_0 and D are given. This estimating equation is $P_{cj} = \rho_0 D^2(1 - 0.713\ \rho_0^{0.03})$. 39 refs., 1 fig. 2 tabs.

46040 (SAND–89-1043C) **Response of standardized PVDF piezoelectric polymer gauges to direct shock pressures between 8 and 32 GPa.** Moore, L.M.; Graham, R.A. Sandia National Labs., Albuquerque, NM (USA). 1989. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-890812–37: American Physical Society topical conference on shock compression of condensed matter, 14-17 Aug 1989). Order Number DE89016811/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Previous fundamental studies of the response of standardized piezoelectric polymer stress gauges have been largely based on impact experiments in which peak pressures as high as 46 GPa are achieved by "ringing up" to peak pressure in times of about 60 nsec. The shock-induced increase in temperature is minimized in this case. In order to study thermal effects and other possible influences in PVDF piezoelectric response, direct shock loading to high pressures have been carried out in high explosive plane-wave loading experiments. Measured piezoelectric charges to pressures up to 10 GPa are found to the the same in both ring-up and direct shock loading. At peak pressures of 32 GPa, the observed charge is reduced by about 20% in the direct shock experiments. 2 refs., 5 figs., 1 tab.

46041 (UCRL-Trans–12241) **Decomposition kinetics and mechanism of explosive chemicals.** (Zha yao ke fen jie de dong li xue he ji li). Lin Ziru; Zi Deying; Wu Chengun; Zhang Mingnan. 17p. Translated from Binggong Xuebao, No. 2, May 1986, pp. 20–29. *Binggong Xuebao (China)*, (2): 20-29 (May 1986). Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48.

Thermal decompositions of linear nitroamines, $R[N(NO_2)CH_2]_mN(NO_2)R$ (R = H, CH_2Cl, and CH_2N_3; m = 1, 2, and 3), were studied by the DTA-IR combination analysis technique and a technique for monitoring the thermal decomposition process with a thermolysis-IR analysis system. The activation energies of the major decomposition reactions were determined and the possible decomposition mechanisms were proposed. A nitroamine polymer, $R[N(NO_2)CH_2]_nN(NO_2)R$ (n > 7), was formed during the decomposition process of some nitroamines. The conditions for the formation of this polymer have been also discussed. 8 refs.

46042 (AD-A–207880/6/XAB) **Slab-model analysis of magnetic and collisional-viscosity effects on the first generation of**

nuclear structure. Interim report. Zalesak, S.T.; Huba, J.D.; Satyanarayana, P. Naval Research Lab., Washington, DC (USA). 27 Apr 1989. 30p. (NRL-MR–6431). Available from NTIS, PC A03/MF A01.

A simple model is postulated for the freezing scale in nuclear plumes, whose success depends strongly on the high M ratios of nuclear plumes, and on the existence of some mechanism which causes the slab growth rate gamma(k) to be sharply peaked when regarded as a function wavenumber k. Although the model derivation is quite different from another mode, the only significant difference in implementation is the use of growth rates valid for all gradient scale lengths, rather than for just the asymptotic long-wavelength limit. This model is only two-dimensional, and hence does not address three dimensional effects, which may be important.

46043 (AD-A–208073/7/XAB) **How nuclear war might start: Scenarios from the early 21st century. Interim report.** Digby, J.; Millot, M.D.; Schwabe, W.L. RAND Corp., Santa Monica, CA (USA). Oct 1988. 139p. (RAND/N–2614-NA). Available from NTIS, PC A07/MF A01.

Scenarios are a useful way to make responsible officials think hard about the future. For officials in the Department of Defense, some of these scenarios must consider the actual use of nuclear weapons, so that they will be better prepared to avoid such situations. To encourage breadth in the formulation of games for official purposes, RAND responded to a request from the Director of Net Assessment to create a number of scenarios for the early 21st century in which conflict would occur or be likely and in which due attention would be given to the political and technological conditions that might then be operational. This Note presents a wide range of such scenarios in sketch form. Several of the scenarios assume varying degrees of success for elements of the current Strategic Defense Initiative program, for new applications of stealth technology, for the National Aerospace Plane, for nonnuclear strategic weapons, and for new surveillance techniques. Applications range from battlefield uses to strategic options.

46044 (DOE/DP–0068) **Defense Programs.** USDOE Assistant Secretary for Defense Programs, Washington, DC (USA). May 1989. 13p. Sponsored by U.S. DOE Defense Programs. Order Number DE89016065/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The following will help you to understand how the US Department of Energy's (DOE) Defense Programs (DP) carries out its national security responsibilities, and includes information about the kinds of programs we manage and where facilities are located. Our more than 60,000 employees and contractor personnel work at two headquarters locations in the Washington Metropolitan area and at various research, production, and test sites throughout the country. While each field facility has its own unique functions, most DP activities involve collaboration between two or more locations. DP's partners in progress encompass thousands of "outsiders" as well, including members of the academic community, industrial leaders, a number of other US Government agencies, and foreign countries. The major program area in DP are: Weapons Activities, Nuclear Materials Production, Defense Waste and Transportation Management, Verification and Control Technology, Nuclear Safeguards and Security, Classification and Technology Policy, and Intelligence. Defense Programs activities include the research, development, testing, manufacture, and retirement of all US nuclear weapons; the production of all nuclear materials needed for the weapons program; and the management of defense-related nuclear wastes. Other responsibilities include developing inertial confinement fusion to support defense needs; strategic defense research; protecting and safeguarding the DOE nuclear materials and facilities; verifying international arms control agreements and controlling sensitive technology transfers; classifying and disseminating information; and administering activities involving nuclear weapons under international agreements for cooperation.

46045 (PB–89-200208/XAB) **Assessment of need for and design requirements of a wind-tunnel facility to study fire effects of interest to DNA.** Pitts, W.M. National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Center for Fire Research. May 1989. 209p. (NISTIR–89/4049). Available from NTIS, PC A10/MF A01.

The objective of this study is to recommend whether or not a new wind tunnel facility should be designed and constructed for the investigation of wind-aided fire spread. The focus is on the types of mass fire that can be expected following a nuclear detonation above an urban environment. The final conclusions of the report are (1) the need for an improved understanding of urban fire spread as it relates to nuclear weapon effects is overwhelming, (2) the authors currently have essentially zero predictive capability for fire damage in an urban environment following a nuclear attack, (3) wind tunnel experiments will not provide all of the required information, but offer the opportunity to substantially improve the understanding of the problem, (4) most existing wind tunnels were designed decades ago and are not well-suited for the required experimentation, and (5) some progress can be and is being made in existing facilities, but substantial improvements in understanding require a new facility and a sustained commitment for support.

46046 (SAND–89-1243) **DOE [Department of Energy] nuclear weapon R and T [research, development, and testing]: Objectives, roles, and responsibilities.** Otey, G.R. Sandia National Labs., Albuquerque, NM (USA). Jul 1989. 33p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89014019/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An overview of the DOE nuclear weapons research, development, and testing program is given along with a description of the program objectives and the roles and responsibilities of the various involved organizations. The relationship between the DoD and DOE is described and the division of responsibilities for weapon development as well as the coordinated planning and acquisition activities are reviewed. Execution of the RD&T program at the nuclear weapons laboratories is outlined. 24 refs., 3 figs.

46047 Cold thoughts on nuclear winter. Katz, J.I. *Transactions of the American Nuclear Society (USA),* 55: 26 (1987). (CONF-871101–: Joint meeting of the American Nuclear Society and the Atomic Industrial Forum, 15-19 Nov 1987).

The nuclear winter controversy is a notorious example of the politicization of science. Large firestorms are followed by soot-laden black rain. It is not known what fraction of the soot produced by fires is removed from the atmosphere in this manner. A simple argument suggests that the fraction may be large. It is even possible to argue that a severe nuclear winter is not self-consistent. It is often assumed that carbonaceous soot is chemically inert in the atmosphere, despite the presence of trace amounts of chemically active species. Even if the magnitude of the nuclear winter effect were known, its implications would remain controversial. Nuclear winter chillings are usually measured as drops in mean temperature. However, reduction in solar heating reduces the diurnal variation as well.

46048 Cleansing of the atmosphere: smoke removal under natural and perturbed conditions. Hallett, J. *Transactions of the American Nuclear Society (USA),* 55: 26-27 (1987). (CONF-871101–: Joint meeting of the American Nuclear Society and the Atomic Industrial Forum, 15-19 Nov 1987).

The overall cleansing of the atmosphere can be related to the efficiency of the precipitation system, which is small for individual cumulus clouds (O), intermediate for air mass thunderstorms (20%), and larger for a steady-state system such as a supercell or a depression (70%). Air processed by the storm is cleaned of its aerosol loading, depending on the detail of the microphysical process. It follows that in any disaster scenario whereby large amounts of smoke are emitted into the troposphere - volcanic eruption, comet impact, nuclear exchange fires - the immediate cloud forming and precipitation processes are of major importance in determining the scavenging rate and overall scavenging efficiency. Even in the unpolluted atmosphere, removal by any precipitation process depends critically on the likelihood of the aerosol containing air passing into a suitable precipitation system. In the case of Chernobyl, with iodine-activated soot, its removals is more likely as it passes into an ice-forming precipitation system, to be removed directly by ice nucleation. In the present atmosphere, statistics of parcel trajectory can give a mean removal rate; in the case of the perturbed atmosphere, major uncertainties remain on the nature and scale of the initial circulations.

46049 Generation of graphitic soot by an urban fire storm. Fields, D.E. (Oak Ridge National Lab., TN (USA)); Cole, L.L. *Transactions of the American Nuclear Society (USA),* 55: 27-28 (1987). (CONF-871101–: Joint meeting of the American Nuclear Society and the Atomic Industrial Forum, 15-19 Nov 1987).

The authors have obtained samples of aerosols deposited during the Hiroshima fire storm that was initiated by the atomic bomb detonated on August 6, 1945. These particles, which we extracted from streaks of black rain found on a plaster wall, are being studied. Initial studies show that the artifact appears to contain aerosol particles that may be representative of the aerosols that may lead to a nuclear winter. Aerosol generation in urban fire storms have been considered by studying these particles. The presence of graphite as a component of these particles is suggested by electron photomicrographs and has been confirmed using Raman spectroscopy, surface ionization mass spectroscopy, and electron scattering for chemical analysis. Several hypotheses are being considered to explain the presence of this form of carbon. Among these are generation in sooty clouds, in raindrops, in the interior of the first storm, and on the wall surface itself. The distribution of particle sizes suggests that the residence time of particles in the atmosphere would be long if they were not removed by rainout. An experimental and theoretical examination of the conditions necessary to produce graphitic soot is in progress.

46050 Defense nuclear agency - global effects program. Auton, D. (Defense Nuclear Agency, Washington, DC (USA)). *Transactions of the American Nuclear Society (USA),* 55: 28-29 (1987). (CONF-871101–: Joint meeting of the American Nuclear Society and the Atomic Industrial Forum, 15-19 Nov 1987).

Considerable progress has been made in the determination and analysis of fuel inventories and their distribution. Nonurban inventories are reasonably well documented and probably sufficient for most global effects analyses. Urban inventories are now in good shape for the United States. Work remains to be completed for European and Soviet urban areas. The largest single uncertainty and driving force for all subsequent analyses is the scenario. Knowing the fuel inventories and their distribution is critical and allows scenario assumptions to be played against the fuel bed data. The second largest uncertainty areas is the amount of smoke that would be produced for any given scenario. Much research is under way that contributes to resolving this issue, but there remain the following nagging problems: (1) dynamics of fire spreading and fire zone behavior; (2) scaling from laboratory and small-field measurements; and (3) relatability of materials burned in item 2 to the real case of interest.

46051 Nuclear late fall. Harris, T.R. *Transactions of the American Nuclear Society (USA),* 55: 29-30 (1987). (CONF-871101–: Joint meeting of the American Nuclear Society and the Atomic Industrial Forum, 15-19 Nov 1987).

This paper examines the policy implications of nuclear winter. The work begins by looking at policy responses to early research, such as the TTAPS study and its precursors, and traces the evolution of responses as the research progressed through the ENUWAR study. Finally, the range of possible current policy responses to the more modest predictions is examined. Additionally, ancillary impact assessment work is also considered.

46052 Extinction cascade: biological consequence of nuclear war/winter. Vaughan, G.L. (Univ. of Tennessee, Knoxville (USA)); Pimm, S.; Fields, D.E. *Transactions of the American Nuclear Society (USA),* 55: 30-31 (1987). (CONF-871101–: Joint meeting of the American Nuclear Society and the Atomic Industrial Forum, 15-19 Nov 1987).

Current estimates suggest that direct human casualties in a full-scale nuclear war will exceed one billion people, largely centered around urban and military/industrial centers of the northern hemisphere. The sheer magnitude of potential for immediate human death and suffering in nuclear attack and retaliatory response has served as an effective deterrent for >40 yr. It has become apparent, however, that short-term human mortality and mobidity may not be the factors of greatest concern. It is probable that a larger impact may be attributable to long-term environmental degradation. The general consensus is that a large nuclear war would produce enough smoke to alter and darken the atmosphere so that most of the northern hemisphere would experience reduced temperature, low light levels, altered rainfall patterns, and toxic smog/rain as well as significant exposure to radioactive fallout. Analysis of the environmental changes associated with early nuclear winter scenarios showed a potential for the extinction of a large portion of the earth's plants and animals. Estimates of nuclear winter consequences contain considerable uncertainty. The considerable uncertainties contained in nuclear winter predictions are mentioned. Considering these uncertainties, it is difficult to make definitive statements about the survival of any individual species. It is not, however, difficult to predict that, even with the mitigated nuclear autumn scenario, a mass extinction of biological species, floral and faunal, will result from large-scale nuclear war.

46053 Nuclear winter: the implications for civil defense. Chester, C.V. (Oak Ridge National Lab., TN (USA)); Perry, A.M.; Hobbs, B.F. *Transactions of the American Nuclear Society (USA),* 55: 31-32 (1987). (CONF-871101–: Joint meeting of the American Nuclear Society and the Atomic Industrial Forum, 15-19 Nov 1987).

It is generally believed possible for some range of heavy nuclear attacks directed against cities that significant but not lethal climate alteration will ensue for at least a few weeks. Three-dimensional global circulation models being developed and used at Lawrence Livermore National Laboratory (LLNL), Los Alamos National Laboratory (LANL), and the National Center for Atmospheric Research for a reasonable attack size seem to be converging on a temperature depression of the order of 10 to 15°C, averaged over all land areas of the temperate region of the northern hemisphere. Temperature depressions as large as 25°C are predicted in the interiors of continents for attacks in the summertime. Winter wars produce temperature depressions of only a few degrees. The authors have drawn the following implications for civil defense of the possibility of nuclear winter: (1) Neither cold nor drought is likely to be a direct threat to human survival. (2) The principal threat of nuclear winter is to agriculture. (3) Nuclear winter does not present an entirely new threat from nuclear war to the United States or the Soviet Union. (4) The consequences of nuclear winter would fall more heavily on the Soviet Union.

46054 Consequences of nuclear winter. Teller, E. (Lawrence Livermore National Lab., CA (USA)). *Transactions of the American Nuclear Society (USA),* 55: 32 (1987). (CONF-871101–: Joint meeting of the American Nuclear Society and the Atomic Industrial Forum, 15-19 Nov 1987).

It is to be expected that the predictable consequences of a nuclear war are more terrible than any of the indirect effects that have been discussed. Detailed calculations on the consequences of massive release of smoke seem to bear out this general expectation. This contrast may become ever more obvious if one takes into account the consequences of defense against a nuclear attack. One cannot expect that such defense will be 100% effective. A reduction of the direct casualties by a factor of 2 will almost certainly result in a substantial reduction in the amount of smoke emitted. In case of no defense, the direct effects of nuclear winter are hard to predict. In the case of defense, the climate changes may well be minor. If one assumes that there will be residual effects on the weather, this is apt to be more important in influencing precipitation rather than the surface temperature. Indeed, the main effect of smoke is to produce a temperature inversion and thereby suppress the convective rainfall. This is particularly true in many regions that produce crops in the norther hemisphere. It seems now well established that the most dangerous potential consequence of any smoke-induced climatic change will be reduction of crops. Fortunately, this danger can be greatly reduced by food storage. Such food storage could greatly reduce domestic shortages in the United States and could also be important in alleviating suffering abroad. The efforts spent on considering the consequence of nuclear winter are not wasted.

4503 Explosion Detection

46055 (SAND–89-0832) **Methods for detecting seismic events at known locations using NORESS [Norwegian Experimental Seismic System] data.** Lee, D.O.; Stearns, S.D.; Wayland, J.R. Jr. Sandia National Labs., Albuquerque, NM (USA). Mar 1989. 44p. Sponsored by U.S. DOE Defense Programs. DOE Contract

AC04-76DP00789. Order Number DE89016921/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The difficulty of detecting, locating and identifying low-magnitude seismic events has been an ongoing problem. In this note, we describe processing methods that help us to find low-magnitude seismic events. A series of algorithms with beamforming has been developed and has proven effective in helping to discover very low yield events. The beamforming technique consists of determining the array element time delays for the specific source region using previously established events. This allows us to concentrate the array to look at the specified source location. Examples of this type of analysis are provided. In the analysis of seismic data one may be in possession of other information, e.g., newspaper reports of an earthquake. Using this information to concentrate the search for an event will often identify an otherwise overlooked signal. The algorithms for this type of search are incorporated into computer software that includes capabilities for plotting, spectral and signal-to-noise estimation, direction finding, and other functions. 2 refs., 25 figs.

46056 (IC–89/34) **Model for the simulation of the ozone budget in the atmosphere under anthropogenic perturbation.** Bestman, A.R. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 10p. Order Number DE89636294/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

A simple model is proposed for the laboratory simulation of the anthropogenic perturbation of the ozone (O_3) in the middle atmosphere. It consists of two vertical plates maintained at very high but nearly equal temperatures, in between which is a binary mixture of a chemically reacting fluid. The plates are rotated about a horizontal axis. Adopting the optically thin non-grey gas approximation for radiative heat transfer, the differential equations governing the velocity components, temperature and mass concentration are integrated in a close form. The solutions show good agreement with the exact integral formalism for the radiative flux under the same assumption of nearly equal wall temperatures. (author). 7 refs, 1 fig.

46057 (AD-A–207667/7/XAB) **Strategic high-altitude atmospheric radiation code (SHARC) user instructions. Technical report, September 1987-January 1989.** Sundberg, R.L.; Duff, J.W.; Bernstein, L.S.; Acharya, P.K.; Gruninger, J.H. Spectral Sciences, Inc., Burlington, MA (USA). 3 Feb 1989. 175p. (SSI-TR–152). Available from NTIS, PC A08/MF A01.

This report describes how to implement and use the Strategic High-Altitude Radiance Code (SHARC). SHARC calculates atmospheric radiation for paths from 60 to 300 km altitude in the 2-40 micrometer spectral region. It models radiation due to NLTE (Non-Local Thermodynamic Equilibrium) molecular emissions which are the dominant sources at these altitudes. This initial version of SHARC includes the five strongest IR radiators, CO_2, NO, O_3, H_2O, and CO. The code is available on magnetic tape and can be obtained by written request to AFGL/OPB.

46058 (CEA-CONF–9764) **High-frequency paleoclimatic variability: a spectral analysis of the Vostok ice-core isotopic record.** Yiou, P.; Genthon, C.; Jouzel, J.; Le Treut, H.; Lorius, C.; Ghil, M.; Korotkevich, Y.S. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Physico-Chimie. 1988. 4p. (CONF-8806390–1: Scaling, fractals and non-linear variability in geophysic, 27 Jun - 1 jul 1988). Order Number DE89791934/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

This paper uses a recently analysed isotopic record from an ice core drilled at the Soviet Antartic Station VOSTOK, representing a total time span of about 160,000 years. Results obtained show the existence of a significative climatic variability at the time scale of 10,000 years and below. The many spectral peaks appear to be approximate linear combination of a little number among them, a clear indication of the non linear nature of climate fluctuations at these "short" time scales.

46059 (DOE/ER/60590–T2) **Meteorological support for space operations: Review and recommendations.** Hosler, C.L.; Forbes, G.S.; Klemp, J.B.; Krider, E.P.; McGinley, J.A.; Ray, P.S.; Snellman, L.W. National Research Council, Washington, DC (USA). Panel on Meteorological Support for Space Operations. [1989]. 86p. Sponsored by DOE/ER;NASA. DOE Contract AI01-87ER60590. Order Number DE89016113/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This report recommends mechanisms by which NASA can put into operation state-of-the-science meteorological technology and advanced weather forecasting techniques to enhance the efficiency, reliability, and safety of space operations. The spirit motivating these recommendations is the panel's belief that NASA should strive to exploit the benefits of the cutting edge of new meteorological technology, just as it exploits the potential of the numerous other technologies that support space flight. In striving to reach this goal, NASA can pave the way for many other applications of these advanced meteorological capabilities.

46060 (EPRI-EL–6413) **Lightning flash characteristics, 1987.** Orville, R.E.; Henderson, R.W.; Pyle, R.B. Electric Power Research Inst., Palo Alto, CA (USA); State Univ. of New York, Albany, NY (USA). Dept. of Atmospheric Science. c Aug 1989. 49p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

A magnetic direction finding system for the detection of lightning flashes to ground has operated in the eastern part of the United States since 1982 and has now expanded to cover over 80 percent of the contiguous United States. Complete coverage is planned for the end of 1988. Time, location, flash polarity, multiplicity (the number of strokes per flash) and the initial peak magnetic radiation field amplitude are recorded in real time. Flash locations, time, polarity, peak current, and multiplicity are displayed routinely for research and operational uses. New results for 1987 include the flash density for strikes to ground in the peak current ranges 0–35 kA, 35–65 kA, 65–100 kA and greater than 100 kA. The lightning information is available to utilities through a satellite communication link for real time access or by phone lines for access to historical data, where the last five million flashes are available. The flash information is being compiled into a data base to provide statistical information necessary for the prediction of the surge performance of electric power lines and the improvement of surge protection practices. Results for the year 1987 are presented in this report. 13 refs., 25 figs.

46061 (LA-SUB–89-1) **DEWFALL X.0 (unverified prototype): Engineering software for non-steady radial energy transfer with vaporization/condensation: Draft user manual.** Walsh, B.; Ruiz, N.; Mattingly, P. Los Alamos National Lab., NM (USA); Science and Engineering Associates, Inc., Santa Fe, NM (USA). 1 Jun 1989. 250p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (SEASF-TR–89-001). Order Number DE89016311/JAW. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

This manual documents the input requirements, execution procedures and output for the unverified prototype of DEWFALL and its postprocessor, DEWPOST. It also describes the purpose and limitations of the software, the physical model that underlies it, and the rationale for the physical model. Instructions for installing and maintaining the software are also included in this manual. It is addressed to users at the developing organization, Science and Engineering Associates, Inc., (SEA), and at the sponsoring organization, Los Alamos National Laboratories (LANL).

46062 (LBL–27436) **Integrated data bases in environmental health applications.** Merrill, D.W. Lawrence Berkeley Lab., CA (USA). Jun 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8906198–1: Environmental databases workshop, 19 Jun 1989). Order Number DE89016339/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Increasingly, public attention is focusing on the health effects of environmental hazards including air pollution, radioactive and toxic wastes, and indoor radon. Typical exposures are at low levels, and have a geographic distribution that can be estimated a priori. In such cases, analysis of routinely collected health surveillance data can be faster, cheaper and more sensitive than specially designed case-control or cohort studies. The health data are linked by geographic location with independently collected census data and environmental exposure data. The units of analysis are geographic areas rather than individuals; such data are known as ecologic data. In analyzing such data, rates calculated for individual subareas are not a suitable measure of risk. If the subareas are too small, stable rates cannot be calculated; if too large, geographic detail is lost. In either case one cannot easily describe trends which vary smoothly across adjacent subareas. We describe a preferred alternative, the mathematical technique of density equalizing map projections. Because ecologic data often cover broad areas and long time periods, the same data find repeated use in different applications. Comprehensive data files are generally too large and complex for commercial data base systems. Conventional analytical techniques are not generally valid for ecologic data. Below the county level, geographic data integration is a difficult task requiring the use of geographic base map files. For all these reasons it is cost effective to permanently integrate major ecologic data files in a publicly shared computing environment.

46063 (PNL–6279-Vol.10) **Hanford Meteorological Station computer codes: Volume 10, The ARCHIVE computer code.** Andrews, G.L.; Burk, K.W. Pacific Northwest Lab., Richland, WA (USA). Aug 1989. 101p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE89016175/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The purpose of the ARCHIVE computer program is twofold: (1) convert selected hourly binary data into formatted ASCII data, and (2) organize the converted data into monthly files. Formatted ASCII files are easier to access on a routine basis. The program is executed once a day and is initiated from a command file that submits itself to the SYS$BATCH queue on a daily basis. The monthly files are stored on the HMS computer's fixed hard disk and are merged into yearly files (located on removable disk packs) at the end of each year. This report describes the data bases maintained at the HMS, gives an overview of the ARCHIVE program, describes input and output files accessed by the ARCHIVE program, provides a description of program initiation, and discusses the limitations of the ARCHIVE program. A section on trouble-shooting is included. In addition, the appendixes contain flow charts, detailed descriptions, and source code listings for the ARCHIVE program and related subroutines. A description of the ARCHIVE command file and the data input and output files completes the report. 3 refs., 1 fig.

46064 (SAND–88-3470C) **Varistor-particle lightning arrestor connector performance under simulated extreme lightning currents.** Fisher, R.J.; Kostas, J.G. Sandia National Labs., Albuquerque, NM (USA). 1989. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909124–2: International conference on lightning and static electricity, 26-28 Sep 1989). Order Number DE89012663/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Varistor-particle lightning arrestor connectors have been tested under simulated lightning currents of peak amplitude up to 185 kA. Each connector was attached to a circuit of representative interest, in which currents were measured at various points. These currents were reproduced in post-test circuit modeling, during which voltages were determined throughout the circuit and response sensitivity to statistical variations in post-breakdown contact-arc voltage was demonstrated. In all cases, resultant downstream circuit voltages were well below the 1500-V criterion. 6 refs., 10 figs., 3 tabs.

46065 (SAND–88-3471C) **Internal voltages and currents in well-shielded cylindrical objects due to stimulated direct-strike lightning.** Fisher, R.J.; Warne, L.K.; Kostas, J.G. Sandia National Labs., Albuquerque, NM (USA). 1989. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909124–3: International conference on lightning and static electricity, 26-28 Sep 1989). Order Number DE89012664/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A variety of cylindrical tests objects of generic interest were tested to simulated severe direct-strike lightning with the intent of bounding possible internal voltages due to joint leakage and currents through low-impedance loads due to diffusion. All the test objects would normally be considered to be high-quality Faraday shields. The highest voltage recorded was 21 V, which was developed across a flange-and-collar joint in a steel cylinder driven longitudinally by a test current of ~160 kA peak. A simple circuit model of the symmetric diffusion process, valid over the frequency range of lightning, is given. 4 refs., 14 figs., 2 tabs.

46066 (SAND–89-1161C) **Data processing in lightning warning systems.** Edrington, T.S. Sandia National Labs., Albuquerque, NM (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909124–1: International conference on lightning and static electricity, 26-28 Sep 1989). Order Number DE89012495/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Data from an array of sixteen electric-field sensors have been used to evaluate the potential benefits to lightning warning systems of processing "old" data as well as data from off-site sensors. These specific topics are approached from a broad decision-theoretic viewpoint. 4 refs., 10 figs.

46067 (SAND–89-7099) **System guide to SPEEDI: The Sandia Partitioned Engineering Environmental Database Implementation.** Kephart, E.M.; Haskell, K.H.; von Laven, G.M. Sandia National Labs., Albuquerque, NM (USA); RE/SPEC, Inc., Albuquerque, NM (USA). Jul 1989. 119p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (RSI–0329). Order Number DE89015166/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

The goal of this undertaking has been for RE/SPEC to furnish technical and administrative coordination and to execute a three-phased project. The project consists of evaluating, designing, and implementing the required database access system. This report documents the software which has been developed, named the Sandia Partitioned Engineering Environmental Database Implementation, or SPEEDI. It is intended for personnel who are responsible for installing, maintaining, and enhancing SPEEDI, as well as for any programmer who wants to access SPEEDI through other software.

46068 The source term in energy deposition calculations. Penetrante, B. M. (Lawrence Livermore National Laboratory, Livermore, California 94550(US)); Bardsley, J. N. *Journal of Applied Physics (USA)*, 66(4): 1871-1874 (15 Aug 1989). DOE Contract W-7405-ENG-48.

A discrete-loss energy deposition model is used to study the functional dependence of the *W* value (mean energy expended per electron-ion pair) on the beam energy and ionization fraction. Two types of secondary electron source terms are considered: one in which energetic electrons are completely stopped by the medium, the other in which a continuous beam passes through the plasma. We show that the *W* value, and hence the energy-loss modes, strongly depend on the type of source term used.

Refer also to citation(s) 44502, 44519, 44796, 45189, 45439, 45720, 45874, 46119, 46120, 46133, 46327, 46330, 46357

46069 (CMHC–870730) **Residential combustion venting failure. A systems approach. Summary report.** Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1987. 145p. (CE–02714). Available from Canada Mortgage and Housing Corporation, Annex Bldg., 628 Montreal Rd., Ottawa, ON, CAN K1A 0P7; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The project reported on here was to expand on previous studies of the problem of incomplete venting of the products of combustion from heating appliances in the Canadian housing stock. The work was subdivided into seven parts: a country-wide survey of approximately 100 houses, the refinement and extension of FLUE

SIMULATOR, a computer model originally developed in 1984-1985, to make it easier to use and to allow to model a wider variety of furnace/flue/house systems, the refinement of existing field detection procedures, a study of the pollutants likely to be released in a house as a result of failed or incomplete venting of combustion products and a study of the health hazards these pollutants might present, a review of remedial measures for correcting or avoiding combustion venting problems and research and development of the more promising such measures, an on-site investigation of problem houses found in the country-wide survey, and the definition of a strategy for disseminating the results of the project. The results indicate that a significant portion of the housing stock has potential for combustion venting failure to occur regularly, but such failures are not necessarily health-threatening. The project has resulted in a marked improvement in our understanding of combustion venting and has identified a number of preventive and remedial measures. 15 refs 26 figs 7 tabs

46070 (CONF-8711322–1) **Methodology for assigning uncertainty values to emissions estimates.** Bassett, G.W. Jr.; Chun, K.C.; Hanson, D.A. Argonne National Lab., IL (USA). [1987]. 10p. Sponsored by U.S. DOE Fossil Energy. DOE Contract W-31109-ENG-38. From Environmetrics '87; 15-18 Nov 1987. Order Number DE89016894/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The National Acid Precipitation Assessment Program (NAPAP) has been developing estimates of the precursors of acid rain as well as uncertainty values for the estimates. In this paper we briefly review some of the proposed methods for assigning uncertainty values to the emissions estimates. We also briefly discuss some of the general issues which have arisen in the process of developing uncertainty values. 3 refs.

46071 (CONF-8908108–1) **Analysis of soil chemistry data for an EPA [Environmental Protection Agency] acid rain assessment.** Wolf, D.A.; Brandt, C.C.; Schmoyer, D.D.; Turner, R.S. Oak Ridge National Lab., TN (USA). 1989. 17p. Sponsored by DOE/ER;EPA. DOE Contract AC05-84OR21400. From American Statistical Association meeting; 9 Aug 1989. Order Number DE89015364/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Direct/Delayed Response Project (DDRP), implemented by the US Environmental Protection Agency (EPA), as part of the National Acid Precipitation Assessment Program (NAPAP), was designed to project the long-term response of selected eastern US watersheds and surface waters to acidic deposition. Specific DDRP tasks include (i) to characterize variability of soil and other watershed attributes, (ii) to determine which of the soil and watershed characteristics are most strongly related to surface water chemistry, (iii) to estimate the relative importance of key watershed processes in controlling surface water chemistry, and (iv) to classify a sample of watersheds with regard to their response time and extrapolate the classification to the population of lakes and streams in the region. An overview of the DDRP is presented relating it to other EPA studies and describing its implementation. The main problems addressed are collinearity and variable selection in multiple regression when the number of variables exceeds the number of observations.

46072 (DOE/ER/60292–5) **Operation and research at the Ithaca MAP3S regional precipitation chemistry site: Annual progress report for 1989.** Butler, T.J.; Likens, G.E. Institute of Ecosystem Studies, Millbrook, NY (USA). Jul 1989. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER60292. Order Number DE89016309/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Ithaca MAP3S Regional Precipitation Chemistry Site, in continuous operation since September 1976 is now operating on a daily sampling rather than event sampling basis. Two other network stations (NDDN and EFPVMN) are co-located currently at the site. Research associated with MAP3S over the last year includes an analysis of the impact of changing emissions levels on precipitation chemistry in the eastern US. From 1977 to 1986 a 20% change in SO_2 emissions and a 10% change in NO_x emissions have occurred over the eastern and midwestern US. Six continental precipitation chemistry sites from the MAP3S network, plus the Hubbard Brook Experimental Forest, New Hampshire, show a direct relationship between emission levels and precipitation concentrations, except for Penn State, Pennsylvania. MAP3S sites at Illinois and Ohio, located closest to the major SO_2 source regions, demonstrate statistically significant ($P < 0.05$) linear regressions of SO_4 concentrations on SO_2 emissions. Hubbard Brook shows the strongest relationship ($P < 0.01$) between SO_2 emissions and SO_4 concentration in precipitation. Only Whiteface Mountain, New York, shows a significant relationships ($P < 0.10$) for NO_x emissions and NO_3^- concentrations. However, Illinois, Ohio, Ithaca, and Hubbard Brook show significant linear regressions of H^+ concentrations on emissions of $SO_2 + NO_x$ ($P < 0.10$, 0.05, 0.05, and 0.01, respectively). Overall, for the entire region examined, decreasing SO_2 emission levels appear to have decreased SO_4 concentrations with an efficiency of 66% + 17% (s.e.).

46073 (DOE/ER/69014–T1) **Assessment of crop response to increases in atmospheric carbon dioxide concentrations: Summary of research progress report, July 1, 1988–June 30, 1989.** Agricultural Research Service, Beltsville, MD (USA). [1989]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AI05-88ER69014. Order Number DE89016251/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

At Beltsville, the 2-dimensional soil model SOILSIM was purchased from a commercial company along with the rights to distribute our own modified version. The model as purchased dealt with the movement of water and solutes in both the unsaturated (rooted) and and saturated portions of the soil. It had simple empirical equations to simulate boundary conditions, no dictionary and very little comment in the code. However, it did have algorithms to predict correctly the movement of materials through a heterogeneous medium. In this respect it was much superior to the soil model RHIZOS incorporated in GLYCIM. Earlier use of the uncertainty analysis program PRISM had revealed how insensitive RHIZOS is to soil input variables and parameters. SOILSIM, has been adapted for use in crop models by inserting comments in the code, preparing a dictionary of variable and parameter names and units, stripping our code dealing with the deeper layers of the soil, and replacing the empirical boundary-condition equations with equations that link to the crop model. The modules dealing with soil water movement and root growth have been incorporated into GLYCIM. 6 refs.

46074 (ECN–89-114) **The influence of manganese leached from plants on dew chemistry.** Arends, B.G.; Eenkhoorn, S. Netherlands Energy Research Foundation, Petten (Netherlands). Jul 1989. 8p. Available from Netherlands Energy Research Foundation ECN, P.O. Box 1, 1755 ZG Petten, Netherlands.

High concentrations of manganese were found in dew water on grass which are believed to be catalytically active for the oxidation of sulfite. In order to describe this oxidation the reaction was studied in a fog chamber. In the concentration and pH range, normally found in dew on grass, the formation of sulfate is linearly dependent on the concentration of manganese and on the square root of the concentration of sulfite. The results indicate that the manganese catalyzed sulfite oxidation is an important reaction in dew on grass. 6 figs., 17 refs., 1 tab.

46075 (EPRI-EN–6492) **Acid precipitation and human health: Final report.** Hoffman, S. Electric Power Research Inst., Palo Alto, CA (USA); Hoffman (S.), Mountain View, CA (USA). c Aug 1989. 134p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

This report, written for environmental managers in electric utilities, reviews potential indirect human health effects of acid precipitation. Possible exposure routes and materials examined in this review include drinking water contamination (aluminum and mercury), corrosion of metals (lead, cadmium, arsenic, selenium, copper, and zinc) and asbestos from water piping, bioaccumulation of mercury and other metals in fish and game, and uptake of mobilized metals in crops. No direct effects (e.g., skin or eye irritation) of human exposure to acid precipitation have been identified, and air pollutant impacts on health are not included in this review, because these pollutants are acid precipitation precursors, not acid precipitation per se. The literature is summarized, presenting results from

researchers' studies to support their conclusions. The review discusses potential acid precipitation impacts on metal levels in drinking water and food, summarizes the health effects of ingestion of these materials, and identifies areas of needed research. Metal-metal interactions in humans that may be related to acid precipitation are identified. Current research programs and planned assessments of the indirect human health effects of acid precipitation are summarized. 136 refs., 38 figs., 17 tabs

46076 (ETDE-mf–9914837) **Emission of pollutants from small furnaces. Current status - measures for pollutant reduction - future points of main support.** Universitaet Stuttgart, Institut fuer Verfahrenstechnik und Dampfkesselwesen. Bericht. Struschka, M.; Straub, D.; Baumbach, G. Stuttgart Univ. (Germany, F.R.). Inst. fuer Verfahrenstechnik und Dampfkesselwesen; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). 1988. 207p. (In German). Contract BMFT 01VQ3446. Order Number DE89914837/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

After looking at the 'state of the art' this study determines research and development projects that need to be undertaken on the area of cutting pollution by small furnaces. Based on energy consumption and heating structure the authors then describe the proportion of oil, gas coal and biogeneous fuels in the total consumption of the Federal Republic of Germany as a whole and of some districts. The basic facts about combustion and the resulting pollution are explained. Pollutant emission from small furnaces is described for each type of fuel. Parameters of combustion and emission of noxious substances are described in detail. Primary and secondary pollution abatement measures are listed and evaluated. Emission factors of various fuels and furnace types are compared. (HWJ).

46077 (GKSS–89/E/8) **Atmospheric input of trace substances into the North Sea and the Baltic Sea.** Grassl, H.; Eppel, D.; Petersen, G.; Schneider, B.; Weber, H.; Gandrass, J.; Reinhardt, K.H.; Wodarg, D.; Fliess, J. GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.); Umweltbundesamt, Berlin (Germany, F.R.). Jan 1989. 165p. (In German). Contract UFOPLAN-Nr. 10402572. Order Number DE89914972/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

The concentrations and deposition of atmospheric trace substances were measured over the Kiel Bight and the Southern North Sea. A European longrange-transport model was used to calculate the atmospheric concentrations of trace metals and their deposition into the North Sea and the Baltic Sea. Natural and anthropogenic emitted element concentrations could be separated definitely by the measurements, and preferred transport directions of anthropogenic contributions could be found. Concentrations measured over the North Sea could be related to the surrounding emission areas by airmass trajectory analyses. The deposition measurements show that the main removal process is due to deposition by precipitation. Calculated and measured concentrations at several receptor points agreed well. The model results confirm the dominating role of wet deposition. It could be shown that extrapolations from measurements at coastal stations to the whole sea area tend to overestimate the total deposition into North Sea and Baltic Sea. (orig.) With 78 refs., 26 tabs., 85 figs.

46078 (IVL-B–922) **Influence of weather on pollution levels and deposition in Swedish background air.** Loevblad, G.; Omstedt, G.; Sjoeberg, K. Swedish Environmental Research Inst., Goeteborg (Sweden). Apr 1989. 65p. (In Swedish). Order Number DE89914804/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

Data from the EMEP network are evaluated to show the influence of weather conditions on air pollution concentrations and deposition in rural areas in Sweden. The highest concentrations of air pollutions are observed during movement of air masses from the south and east sectors, shortly after periods of high air pressure, cold weather and stable conditions in central Europe. The largest amount of wet deposition occur during periods of greatest precipitation, and the highest concentrations of pollutants in precipitation are observed during periods of low precipitation (<0.5 mm).

46079 (Juel-Spez–502) **CO_2-reduction potential through rational energy utilization and use of renewable energy sources in the Federal Republic of Germany.** Kolb, G.; Eickhoff, G.; Kleemann, M.; Krzikalla, N.; Pohlmann, M.; Wagner, H.J. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Programmgruppe Systemforschung und Technologische Entwicklung. May 1989. 83p. Order Number DE89915136/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

The paper analyses the most important reduction potentials of the private passenger car transportation, of the space heat sectors, of the electricity production sector, of the various industrial sectors and of electricity applications in the industrial, commercial and residential sectors. Additionally the effect of an exploitation of the potential of the renewable energy sector is investigated. Reference is the emission of the energy sector in 1987 of about 770 mill. t CO_2. The identified technical reduction potential for private passenger car transportation is about 19 mill. t CO_2/a at maximum, for the industry about 20 mill. t CO_2/a, through improvement of the efficiency of electrical appliances in the residential and commercial sector about 34 mill. t CO_2/a and for the space heat technically at least 120 mill. t CO_2/a. The exploitation of the renewable energy sector could reduce the emissions by about 31 mill. t CO_2/a and the maximum reduction through the improvement of efficiency of electricity production is about 20 mill. t CO_2/a without substitution of energy carriers. The identified CO_2-reduction options in the space heat sector and the majority of the technologies for the utilization of renewable energy sources are not economically viable at present and in the medium term. (orig./HP).

46080 (NILU-F–6/88) **NOx emissions from stationary sources in Eastern Europe. Relating NOx emission to the statistical data on fossil fuel consumption and industrial production.** Pacyna, J.M. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1988. 19p. (CONF-8803232–1: IIASA/NILU Task Force meeting on accuracy of emmission inventories, 8-10 Mar 1988). Order Number DE89914748/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The purpose of the work is to: (1) present the NOx emission estimates from stationary sources in Eastern Europe (2) discuss the NOx emission factors used in various regional emission inventories and (3) relate NOx emissions to statistical data on the consumption of fossil fuels and the production of various industrial goods. The work is a part of a research programme on estimating the NOx emissions from anthrogenic sources in Europe, carried out at the Norwegian Institute for Air Research under contract with the Environmental Protection Agency of the Federal Republic of Germany. Reliability of the results are discussed versus external factors. 1 appendix, 7 tables, 16 references.

46081 (NUREG/CP–0098-Vol.1, pp. 409-429) **Three-part strategy for continuous extractive monitoring of hazardous particulate emissions from exhaust stacks.** Schmidt, A.C. (Schmidt Instrument Co., San Carlos, CA (USA)). Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.1: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 1–5.* Order Number DE89014647/JAW. Available from NTIS, PC A99/MF A01 - I.

Because of transmission losses, the customary isokinetic sampling procedures that are used for short interval aerosol sampling are not appropriate for continuous extractive monitoring of hazardous particulate emissions from exhaust stacks. A three-part strategy is described in this paper in which (1) the importance of particle size is recognized in relation to probe transmission and to the performance that is needed; (2) the sample is extracted where it will include all particle sizes that are present; and (3) transmission and entry losses are minimized by employing the latest advances in probe design and operation. Some of the points that are emphasized include: the need for specifying monitoring system performance as a function of particle size; the need for quantitative performance testing; and the need for keeping the flow in a monitoring probe constant at the flow of best transmission, and using other means, such as flow substitution, for matching the stack velocity.

46082 (NUREG/CP–0098-Vol.2, pp. 943-958) **Structural activated carbon-carbon composition media for fabrication of air and water filters.** Brassell, G.W. (Nuclear Filter Technology, Inc., Golden, CO (USA)). Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

An activated structural carbon bonded carbon fiber composite exhibiting surface area values in excess of 800 m^2/g, compressive strength values of 30 to 150 psi and macro porosity (>1 micrometer) values of 65 to 95% has been developed and patented. As a result of the structural stability of the activated carbon composite, air and water filters fabricated with this media can survive overpressures caused by mishandling or a large pressure surge. The carbon composite media also will perform as a dual gas/particulate filter (adsorption of hazardous gases and entrapment of particulates). Tests performed on the media reveal that the material can be manufactured to exhibit a filtering efficiency of greater than 99.97% when DOP tested.

46083 (NUREG/CP–0098-Vol.2, pp. 959-972) **Aerosol filtration kinetics - a conceptual approach.** Jonas, L.A. (Hughes Associates, Inc., Wheaton, MD (USA)). Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

In the past the study of aerosol filtration by fibrous filter mats has concentrated on the elucidation of the mechanisms of filtration, delineating the fractional contributions of diffusion, impaction, and inertia to the overall filtration efficiency. A conceptual approach is offered which would study the kinetics of aerosol filtration, concentrating on determining the aerosol filtration capacity and aerosol filtration rate constant of the filter mat. Since all physical systems can be characterized by two fundamental properties, namely a quantity factor and an intensity factor, it is expected that the filtration capacity and filtration rate constant will relate respectively to these two properties. Using the basic relationships originally derived from a continuity equation of mass balance, and a methodology analogous to that used to study the kinetics of gas adsorption, an equation was developed which should permit the determination of the aerosol filtration capacity and rate constant values for various filter mats from a series of life-thickness plots for the mats. By plotting the protective life in minutes, required to produce a chosen fractional exit to inlet aerosol penetration ratio, against the mat weight or thickness, a straight line should result from which one should be able to determine respectively the filtration capacity and filtration rate constant of the mat. The effect of superficial linear velocity on the capacity and rate constant parameters can also be determined by the same methodology. Aerosol and filter mat variations in size and type can be factored into a test program matrix to fully assess the kinetics of aerosol filtration.

46084 (NUREG/CP–0098-Vol.2, pp. 1083-1093) **Kinetics analysis of thio-alcohol on the fixed bed of activated carbon.** Kunmin, Guo (Research Institute of Chemical Defence, Beijing (China)); Cunqiao, Yuan; Lan, Ma; Yan, Wu. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

In examining the escaping vapor of thio-alcohol in pharmaceutical process, the author discusses its experimental measurement and kinetics analysis on the fixed bed of activated carbon in its cleaning process. To solve the problem of the deposit organic sulfur, gas chromatograph SP-2308 has been improved. The adsorption isotherms of thio-alcohol on five kinds of activated carbon are thus determined by chromatography, and adsorption breakthrough curves for thio-alcohol on the fixed bed of activated carbon are eventually investigated. The partition ratio of thio-alcohol on solid-gas and number of mass-transfer units of the bed can be determined under the experimental conditions by means of Model Thomas and Function Bessel. In conclusion the author reveals that the match of breakthrough curve of the thio-alcohol on the activated carbon bed and the prediction of breakthrough curve in low concentration can be satisfactorily acquired through experiments with three given parameters and the application of Model Yoon.

46085 (NUREG/CP–0098-Vol.2, pp. 1137-1143) **New 0.05 μm, 0.1 CFM optical particle counter.** Lieberman, A. (Particle Measuring Systems, Inc., Fremont, CA (USA)). Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

A new optical particle counter is described that is capable of counting and sizing particles from 0.05 μm to 5 μm in diameter. The air sample flow rate is 2.8 liters per minute (0.1 CFM). Counting efficiency is 100% for particles over 0.08 μm. Coincidence counting error is less than 10% at concentrations of 3500/liter. The counter uses a high power active cavity illumination system derived from a relatively low power HeNe laser. Scattered light is collected at 90 $\pm$ 45 with a parallel array detector. Data are shown in eight size ranges in either tabular or graphical format.

46086 (NUREG/CP–0098-Vol.2, pp. 1179-1188) **Laser spectrometry technique for the determination of aerosol characteristics. Preliminary checks of the system and first results obtained.** Mazzacurati, V. (Universita "La Sapienza", Roma (Italy)); Platini, M.; Neri, E. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

A system for measuring size distribution, concentration and average velocity of aerosol particles, by means of a light scattering technique is under study in our laboratory. In its ultimate configuration, it should allow to handle concentrations up to 10^7 particles/cm^3 and particle dimensions within the 0.1 $\div$ 1.0 μm range. A preliminary study using polystyrene latex spheres (PLS) suspended in ethyl alcohol has been performed to ensure continuous laminar flow condition and controlled monodispersion. An argon-ion laser operating at 514.5 nm (TEM_{oo}) has been used. The scattering volume V_s has been defined setting the collection optics at an angle of 90° with respect to the laser beam direction. The dimensions of V_s have been selected to operate in single particle mode. Particle sizing is obtained by measuring the peak intensity of the light pulses scattered within a given acceptance angle ($I\Delta\Omega$). Preliminary results, obtained with a uniform intensity distribution realized using the reduced image of a slit illuminated by the laser beam, are presented and discussed.

46087 (OE/ARB–056-88-ARSP) **Air quality in the Sarnia area, July 1986.** Chapman, R.E.; DeBrou, G.B. Ontario Ministry of the Environment, Toronto, ON (Canada). Air Resources Branch. 1988. 42p. (MICROLOG–89-02237). Available from Ontario Ministry of the Environment, Public Information Office, 135 St. Clair Ave. West, Toronto, ON, CAN M4V 1P5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Three mobile air monitoring units (MAMUs) performed two air quality studies in the greater Sarnia area in July, 1986. The purpose of the main study was to determine the ambient air concentrations of a large number of compounds which may be emitted from industries located in Sarnia. The purpose of the secondary study was to determine if polychlorinated biphenyls (PCBs) were present in the emissions from the thermal oxidation (TOX) incinerator of the Dow

Chemical plant in Sarnia. For ease of analysis and comprehension the Sarnia area was split into five zones. The Vidal street industrial zone produced the largest 1/2-hour average concentration for most of the compounds. The Vidal, Indian Road, and Point Edward zones produced most of the highest concentrations for particular organic compouund; however, the mean concentration was larger for more compounds in the downtown Sarnia zone than in the other zones, probably due to its centralized location. On the occasions when polar organic compounds were detected and identified by the MAMU the concentrations were extremely low. During three days of monitoring near the TOX incinerator all of the measurements for total PCBs were below the MAMU detection limits of 0.13 $\mu g/m^3$ (average). The mean concentration of the total chlorinated organics measured by MAMU #2 was larger near the TOX incinerator than in the general Sarnia area. None of the common contaminants such as SO_2, NO_2, CO, total reduced sulphur, and ozone exceeded the Ontario standards or guidelines in any of the zones during the study. This also applied to the organic compounds measured. 6 figs., 12 tabs.

46088 (OE/ARB–ARB-052-87) **Mobile TAGA [trace atmospheric gas wnalyzer] survey. Sunohio molle PCB destruction facility Firestone Steel Products, London, December, 1986.** DeBrou, G.B. Ontario Ministry of the Environment, Toronto, ON (Canada). Air Resources Branch. 1987. 20p. (MICROLOG–87-03893). Available from Ontario Ministry of the Environment, Public Information Office, 135 St. Clair Ave. West, Toronto, ON, CAN M4V 1P5; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

On December 9 and 10, 1986, the mobile Trace Atmospheric Gas Analyzer (TAGA) unit conducted an air monitoring survey at the Firestone Steel Products Plant in London, Ontario. The survey objective was to provide near real-time measurements of ambient polychlorinated biphenyls (PCBs) during the decontamination of three active electrical transformers containing up to 1400 ppM of PCBs. The transformers were decontaminated by Sunohio Canada using a mobile PCB destruction unit. During the 2 day survey period, a total of 225 2-minute air samples were screened for selected PCBs using the TAGA unit. None of the 15 half-hour averaged concentrations of PCBs exeeded the Ontario environment ministry guideline of 0.45 $\mu g/m^3$. In fact, all readings for ambient PCBs were below the analytical detection limits (0.07 $\mu g/m^3$), despite sampling just 0.5 metres from Sunohio's exhaust vent. 4 figs., 2 tabs.

46089 (OH/RD–88-145-K) **Sampling of polychlorinated biphenyl and volatile organic emissions from a mobile PCB destruction facility.** Curtis, K.E. Ontario Hydro Research Div., Toronto, ON (Canada). 1988. 24p. (MICROLOG–89-02554). Available from Ontario Hydro Research Division, Records Clerk, Bldg. KR 107, 800 Kipling Ave., Etobicoke, ON, CAN M8Z 5S4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

As part of a provisional certificate of approval for the operation of a mobile polychlorinated biphenyl (PCB) destruction unit (MPU-1) the Ontario Ministry of the Environment required that Ontario Hydro carry out an emission testing program. Concentrations of PCB and 14 specified volatile organic compounds were to be measured both before and after the emission control device, consisting of two carbon filters in series was installed. A sampling protocol was designed and submitted to the Ministry for approval prior to the test program. Samples were collected on three consecutive days in December, 1987 and submitted for analyses. Apart from an MPU-1 system malfunction during the initial attempt to collect samples, the program was completed without any major mishaps. However, the presence of a fine oil mist in the vent gas prior to the control device has caused some problems with sample collection efficiency, analysis and the performance of the control device itself. 7 refs., 2 figs., 6 tabs.

46090 (OH/RD–88-162-K) **Emission concentration of polychlorinated biphenyls and volatile organics in the vent gas of a mobile PCB destruction facility.** Curtis, K.E. Ontario Hydro Research Div., Toronto, ON (Canada). 1988. 21p. (MICROLOG–89-02543). Available from Ontario Hydro Research Division, Records Clerk, Bldg. KR 107, 800 Kipling Ave., Etobicoke, ON, CAN M8Z 5S4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

An emission testing program has been carried out to determine the concentrations of polychlorinated biphenyls (PCB) and 14 volatile organic compounds in the vent gas of a mobile PCB destruction unit during the processing of an oil mixture in storage. The discovery of a fine mist of oil in the vent gas system during the operation of the unit has somewhat jeopardized the success of the test program. Its presence adversely affected the collection efficiency of the adsorption tubes used to sample some of the compounds and caused a rapid deterioration in the performance of the emission control device. This oil mist must be eliminated before the normal emissions from the process can be measured. Regardless of the above problem, only seven of the 15 compounds specified for testing were detected in the vent gas. The detection of these compounds can be attributed directly to their presence in the feed oil, and therefore the oil mist in the vent gas. This oil stock was rather unique in that it consisted of a complex misture of insulating and lubricating oils plus a variety of solvents and other volatile organic compounds. Benzene was found at the highest concentrations because it is a product of the dechlorination process. The feed oil was found to contain sufficient quantities of various chlorinated benzenes to account for the emitted benzene. PCB (in this case, Aroclor 1260) emissions were the lowest at less than 2000 ng/m^3, and would probably be even lower in the absence of the oil mist in the vent gas system. 3 refs., 19 tabs.

46091 (ORNL/TM–11065) **Soil nitrogen and ozone effects on growth, physiology, and nutrition of loblolly pine and yellow-poplar seedlings.** Tjoelker, M.G.; Luxmoore, R.J.; Schwarz, O.J. Oak Ridge National Lab., TN (USA). Jun 1989. 110p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89015679/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The effects of soil nitrogen level and chronic ozone (O_3) stress on carbon and nutrient economy were investigated in loblolly pine (Pinus taeda L.) and yellow-poplar (Liriodendron tulipifera L). The objectives of the study were: (1) to compare the growth and biomass partitioning in seedlings in response to varied low-nitrogen forest soil treatments in combination with chronic ozone levels over one growing season and (2) to investigate seedling physiological responses, including water use efficiency (WUE), photosynthesis, fine root and leaf nitrate reductase activity (NRA), nutrient concentration, nutrient uptake, and nutrient use efficiency (NUE). 135 refs., 12 figs., 16 tabs.

46092 (ORNL/TM–11184) **International impacts of global climate change: Testimony to House Appropriations Subcommittee on Foreign Operations, Export Financing and Related Programs.** Fulkerson, W.; Cushman, R.M.; Marland, G.; Rayner, S. Oak Ridge National Lab., TN (USA). 21 Feb 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89014004/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

International impacts of global climate change are those for which the important consequences arise because of national sovereignty. Such impacts could be of two types: (1) migrations across national borders of people, of resources (such as agricultural productivity, or surface water, or natural ecosystems), of effluents, or of patterns of commerce; and (2) changes to the way nations use and manage their resources, particularly fossil fuels and forests, as a consequence of international concern over the global climate. Actions by a few resource-dominant nations may affect the fate of all. These two types of international impacts raise complex equity issues because one nation may perceive itself as gaining at the expense of its neighbors, or it may perceive itself as a victim of the actions of others. 11 refs., 2 figs., 1 tab.

46093 (PB–89-183032/XAB) **Mathematical modeling of cloud chemistry in the California South Coast Air Basin. Final report, August 1987-December 1988.** Seigneur, C.; Wegrecki, A.M.; Richards, L.W. Bechtel Environmental, Inc., San Francisco, CA (USA). Dec 1988. 117p. Available from NTIS, PC A06/MF A01.

The formation of sulfate and nitrate species in the California South Coast Air Basin (SoCAB) is a topic of great importance in air quality because these species lead to acid deposition, visibility

degradation, and increased aerosol concentrations. The California Air Resources Board (CARB) has sponsored several field programs over the past four years to characterize the reactants, products, kinetics and mechanisms of stratus cloud chemistry in the SoCAB. In this study, a comprehensive computerized mathematical model of cloud chemistry and physics was used to investigate the chemical and physical processes that govern the formation of acidic species in clouds. First, the performance of the model treatment of equilibrium chemistry and chemical kinetics is evaluated. Then, the model was used to investigate the chemical pathways and transport processes that lead to acid formation in clouds and to study the sensitivity of the acid concentrations to various chemical and meteorological parameters.

46094 (PB–89-183040/XAB) **Fate of hexavalent chromium in the atmosphere. Final report, January 1987-June 1988.** Grohse, P.M.; Gutknecht, W.F.; Hodson, L.; Wilson, B.M. Research Triangle Inst., Research Triangle Park, NC (USA). Oct 1988. 194p. (RTI–3798/00-01F). Available from NTIS, PC A09/MF A01.

A three-phase study was conducted to determine the fate of hexavalent chromium (Cr(VI)) in the atmosphere. Components of the study included (1) evaluation of sampling and analytical methods; (2) determination of Cr(VI) chemical pathways in the atmosphere through a series of laboratory reaction chamber tests; and (3) validation of the laboratory findings through a series of field tests. Ion chromatography utilizing photometric detection was found to be the most precise, sensitive, and rapid measurement technique. The method allowed for detection of Cr(VI) atmospheric concentrations of less than 0.1 ng/cu m. The sampling method found to provide the greatest stability of Cr(VI) during sampling utilized a 0.02M Na_2CO_3 impinger solution. Collection efficiencies exceeded 95% for this device. Laboratory studies indicated that Cr(VI) demonstrates a half life of approximately 13 hours in the presence of chemical species characteristic of atmospheres in the Los Angeles area. Actual field tests in the Los Angeles area showed a Cr(VI) half life of approximately 16 hours.

46095 (PB–89-189856/XAB) **Application guide for the source PM10 exhaust-gas recycle sampling system.** Martin, R.S.; Dawes, S.S.; Williamson, A.D.; Farthing, W.E. Southern Research Inst., Birmingham, AL (USA). Apr 1989. 151p. Available from NTIS, PC A08/MF A01.

The document describes assembly, operation, and maintenance of the Exhaust Gas Recycle (EGR) sampling system. The design of the sampling train allows the operator to maintain a constant flow rate through an inertial sampler while the gas flow rate into the sampling nozzle is adjusted to remain isokinetic with the local duct velocity. The manual specifically addresses the operation of the EGR system for determination of stationary-source PM-10 emissions. Material in the text includes: construction details, calibration procedures, presampling calculations, sample retrieval, data reduction, and equipment maintenance.

46096 (PB–89-191175/XAB) **Carbonaceous species methods comparison study: University of Minnesota results. Final report.** McMurry, P.H.; Zhang, X. Minnesota Univ., Minneapolis, MN (USA). Particle Technology Lab. Oct 1988. 60p. (PUB–668). Available from NTIS, PC A04/MF A01.

See also PB–88-175898.

The Carbon Methods Comparison Study conducted during August 12-20, 1986 at Citrus College, Glendora, CA in the Los Angeles basin compared analytical methodologies for analyzing the carbon content of aerosol samples, as well as compared measurements acquired with different samples. Five samplers, including a multistage microorifice uniform deposit impactor (MOUDI), a conventional quartz filter, a specially designed electrostatic precipitator (ESP), and 2 identical single stage MOUDIs were used. One of the single stage MOUDIs was used as a fine particle sampler; the second was used in experiments to investigate possible sampling articles. The results are summarized and discussed.

46097 (PB–89-194294/XAB) **Fiscal year 1987 summary report of NOAA (National Oceanic and Atmospheric Administration) Meteorology Division support to the environmental protection agency. Technical memo.** Viebrock, H.J.; Poole-Kober, E.M. National Oceanic and Atmospheric Administration, Silver Spring, MD (USA). Air Resources Lab. Apr 1989. 62p. (NOAA-TM-ERL-ARL–170). Available from NTIS, PC A04/MF A01.

See also report for 1986, PB–88-213624.

The Meteorology Division provided meteorological research and operational support to the U.S. Environmental Protection Agency. Basic meteorological operational support consisted of the application of dispersion models, and the conduct of dispersion studies and model evaluations.

46098 (PB–89-194864/XAB) **Capsule report: Environmental controls at a secondary lead smelter.** Schwitzgebel, K.; Vandervort, R. Radian Corp., Austin, TX (USA). Jul 1988. 24p. Available from NTIS, PC A03/MF A01.

The Environmental Protection Agency and the National Institute for Occupational Safety and Health have sponsored a study of environmental and workplace controls at a domestic secondary lead smelter. The study was intended primarily to develop information important to the effective control of environmental emissions and employee exposure. The study was carried out at East Penn Manufacturing Company in Lyons, PA. It comprised an initial baseline evaluation of environmental and workplace controls. In the followup sampling and analysis to characterize the East Penn lead smelter, the four major areas of interest were process source emissions, baghouse efficiency, employee exposure and workplace controls, and agglomeration furnace performance. Emission rates for specific lead smelting and refining operations were determined on sources hooded for emission control in the sanitary baghouse. These sources were sampled for total lead, total particle loading, and particle size distribution. Test results are reported for various sources upstream and downstream of the control systems. Employee exposures to airborne lead were reduced significantly after the control systems were in operation.

46099 (PB–89-197222/XAB) **Assessing multiple pollutant multiple source cancer risks from urban air toxics: Summary of approaches and insights from completed and ongoing urban air toxics-assessment studies.** Sullivan, D.; Lahre, T.; Alford, M. Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards. Apr 1989. 261p. (EPA–450/2-89/010). Available from NTIS, PC A12/MF A01.

The primary purpose of this report is to assist State, local and other agency personnel by describing methods that have been used in assessing multiple source, multiple pollutant risks from air-toxics exposures in urban areas. The report does not constitute formal EPA guidance for conducting an urban risk assessment, nor does it recommend a single approach. Instead, it identifies techniques that others have elected to employ and offers insights that may assist the reader in selecting a particular set of techniques for use in a given locale. Major topics covered include (1) a summary of completed and ongoing urban air toxics assessment studies, (2) ambient monitoring assessment approaches, (3) emission inventory/dispersion modeling assessment approaches, (4) aspects of exposure and risk assessment, (5) control strategy evaluation, (6) data handling, and (7) evolving assessment technologies, including receptor modeling, personal monitoring, and bioassay sampling.

46100 (PB–89-201859/XAB) **Acid-precipitation patterns and trends in eastern North America, 1980-1984.** Seilkop, S.K.; Finkelstein, P.L. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. 1987. 18p. (EPA–600/J-87/478). Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Climate and Applied Meteorology, Vol. 26, No. 8, 980-994(Aug 1987). See also PB–84-157932.

Using data compiled from seven nationwide precipitation-chemistry networks in the U.S. and Canada, the spatial distribution of hydrogen, sulfate, and nitrate ions in North America is discussed. Geographic patterns of concentration and deposition are characterized using isopleth maps which are presented and interpreted for the years 1980-1984. The maps were developed using a geostatistical technique known as kriging. This method allows for the estimation of confidence limits on interpolated values. Using these limits, the significance of an observed decrease in the spatial patterns of deposition and concentration is assessed. Decreases of as large as 15 to 20% were observed in sulfate and nitrate concentrations between 1980 and 1983.

Pub. in Jnl. of the Air Pollution Control Association, Vol. 38, No. 9, 1114-1119(Sep 1988).

This paper is a formal response to the 1988 APCA Critical Review of Ozone Air Quality Models by Dr. John Seinfeld. His Critical Review was a comprehensive discussion on the state of knowledge of urban ozone air-quality models. The paper extends Seinfeld's review in the areas of model components and input data, emissions inventories, uncertainties in wind fields, regional scale ozone models, model evaluation, and future research directions.

46102 (PB–89-206668/XAB) **Air-pollution climatology around an isolated point source using convective scaling parameters.** Pierce, T.E. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. 1988. 15p. (EPA–600/J-88/333). Available from NTIS, PC A03/MF A01.

Pub. in Atmospheric Environment, Vol. 22, No. 11, 2463-2475(1988).

An air-pollution climatology, which incorporated convective scaling parameters, is used to investigate the conditions associated with hourly sulfur dioxide concentrations from a coal-fired power plant. One year of data from the Paradise power plant in central Kentucky (U.S.A.) was analyzed. Variables examined included emission rate, plume rise, wind speed, wind direction, stability class, convective scaling velocity, and similarity categories. The results show the meteorological conditions leading to high surface concentrations are the daytime hours having neutral/unstable atmospheric stability, light winds, and effective plume height to mixing height ratios typically greater than 0.85. In more than half of the 30 hours of highest observed concentrations, the atmospheric conditions satisfy the criteria for mixed-layer scaling.

Supersedes PB–88-867254.

This bibliography contains citations concerning laboratory and clinical studies, and case histories of chronic health effects related to asbestos. Topics include descriptions of disease progression, mortality, and survival studies, and epidemiological and immunological aspects of asbestos-related disorders. Synergistic effects with cigarette smoking are also examined. (This updated bibliography contains 94 citations, 36 of which are new entries to the previous edition.)

46104 (PB–89-865786/XAB) **Gas scrubbers used in pollution control. August 1987-July 1989 (Citations from the COMPENDEX data base). Report for August 1987-July 1989.** National Technical Information Service, Springfield, VA (USA). Jul 1989. 55p. Available from NTISPC N01/MF N01.

Supersedes PB–88-866652.

This bibliography contains citations concerning particle and gas scrubbers. Topics include design aspects, performance evaluations, gas flow analyses, and pollutant chemistry. Pollution control of SO_2, NOX, CO, CO_2, hydrocarbons, and particulates is discussed. (This updated bibliography contains 96 citations, 39 of which are new entries to the previous edition.)

46105 (PB–89-865893/XAB) **Air pollution emission factors. August 1986-July 1989 (Citations from the NTIS data base). Report for August 1986-July 1989.** National Technical Information Service, Springfield, VA (USA). Jul 1989. 88p. Available from NTISPC N01/MF N01.

Supersedes PB–88-866637.

This bibliography contains citations concerning emission factors for a variety of industrial, stationary, and mobile sources. Emissions inventories are discussed in terms of specific compounds, as well as by source type. Computer simulations utilizing emission factors in air-pollution-impact studies are also included. (This updated bibliography contains 139 citations, 56 of which are new entries to the previous edition.)

46106 (UBA-FB–89-031/1) **Standardization of the emission measurement of polycyclic aromatic hydrocarbons. Final report.** Luetzke, K.; Burk, H.D.; Kiesel, G.; Rentel, S.; Wehde, K.H. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). 31 Jul 1988. 231p. (In German). Contract UFOPLAN-Nr. 10402163. Available from Copy held by UB/TIB Hannover.

A part-flow PAH emission measurements sampling system, in which the waste gas extracted from the waste gas duct is diluted by dry, purified and possibly cooled ambient air, was further developed and optimized. The aim was to be able to apply this sampling procedure to stationary installations within the context of a standardized measuring process in the meaning of the clean air regulations 'TA Luft'. The procedure characteristics were determined in accordance with the guideline VDI 2449, as were the parameters, under which PAH losses can be kept to a minimum in the sampling and analysis. In addition, measurements were carried out on various types of installations with different PAH concentrations, in the waste gas. The tests concentrated on the PAH benzo(a)pyrene and dibenz(a,h)anthracene relevant to the TA Luft. In addition to this, other PAHs were also determined and the PAH profiles were recorded in order to characterize the installations tested. For selected PAHs the reproducibilities for three different concentration ranges were determined, as were the rate of relocation and the time-based invariancy of the PAH profile in relation to the waste gas matrix (aggressive components) and on the oxidation sensitivity of the individual PAHs. The detection limit of the sampling and analysis procedure is essentially determined by the blind PAH values of the filter material. The results of the R and D project were incorporated into the draft of guideline VDI 3873. (orig.) With 44 refs., 38 tabs., 25 figs.

46107 (UBA-FB–89-031/2) **Preliminary investigations for standardizations of emission measurements of polychlorinated dibenzo-p-dioxins (PCDD) and furans (PCDF). Final report.** Luetzke, K.; Kiesel, G.; Rentel, S.; Wehde, K.H. Rheinisch-Westfaelischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.). Zentralabteilung Emissionsmessungen; Umweltbundesamt, Berlin (Germany, F.R.). May 1988. 108p. (In German). Contract UFOPLAN-Nr. 10402163. Available from Copy held by UB/TIB Hannover.

The aim of research was to ascertain foundations for standardization of emission measurements of polychlorinated dibenzo-p-dioxins (PCDD) and furans (PCDF). With the LAGA method and the dilution method, this system is already in action at RWTUeV for measurement of PAH emissions (UBA-FE-project 104 02 163); double and fourfold determinations were carried out in stack gas of one municipal waste incineration plant. Stack gas samples taken at the same time and by two sampling apparatures of the same kind give approximately equal or similar PCDD/PCDF emission concentrations and isomer distribution patterns. The PCDD/PCDF emission concentrations and the recoveries found by the dilution method are three to nine times higher. The dilution method as compared with the LAGA method, has the following advantages: isokinetic suction, over 98% separation on the first filter, avoidance of thermal, chemical and catalytic reactions as a consequence of dilution and cooling at 40^0C, no problems with purification of the measuring apparatus, measurements in horizontal and vertical axis. (orig.) With 18 refs., 46 tabs., 23 figs.

46108 (UCRL–21199) **Wind-tunnel study of atmospheric dispersion of exhausts from the NDERF building stack.** Stein, W.; White, B.R.; Kavanagh, J.; Brucker, D.; Castro, E.; Bagheri, N.; Strataridakis, C.J. Lawrence Livermore National Lab., CA (USA). Jan 1989. 46p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89016510/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The dispersion of trace amounts of gases or particles from the stack of the NDERF building at Lawrence Livermore National Laboratory was investigated by conducting scaled experiments in an atmospheric wind tunnel. The stack is 35m tall and is located in a

suburban-type setting near two- and three-story buildings and medium-height trees. The wind-tunnel boundary layer was representative of a slightly unstable atmosphere with velocity and turbulence intensity profiles comparable to those in full scale at the Laboratory. Wind-tunnel tests consisted of releasing an ethane tracer gas from the stack in the tunnel and measuring ground-level concentration profiles and vertical concentration profiles. Tests were conducted for conditions representative of wind speeds of 7 mph and for north, west, and east wind directions. Smoke tracer tests were also conducted to visually show the shape of the dispersing plume. Results of the smoke tests show that the dispersing plume makes contact with the building's roof air intakes. Results of the dispersion experiments show values of peak ground-level concentrations generally occurring 600m downstream of the stack. Wind-tunnel ground-level concentrations show close agreement with those predicted by Gaussian dispersion models. 8 refs., 22 figs., 2 tabs.

46109 (UCRL–21200) **Wind-tunnel study of atmospheric dispersion of exhausts from the stack of building 222.** Stein, W.; White, B.R.; Kavanagh, J.; Brucker, D.; Castro, E.; Bagheri, N.; Strataridakis, C.J. Lawrence Livermore National Lab., CA (USA). Jan 1989. 76p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89016520/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

The dispersion of trace amounts of gases and particles from the stack of Building 222 at Lawrence Livermore National Laboratory was investigated by conducting scaled experiments in an atmospheric wind tunnel. The stack is 28m tall and is located in a suburban-type setting surrounded by two- and three-story buildings and medium- height trees. The wind-tunnel boundary layer was representative of a slightly unstable atmosphere with velocity and turbulence intensity profiles comparable to those in full scale at the Laboratory. Wind-tunnel tests consisted of releasing an ethane tracer gas from the stack in the tunnel and measuring horizontal and vertical concentration profiles as well as ground-level concentration profiles to distances of 600m from the stack. Tests were conducted for conditions representative of wind speeds of 6 mph and 11 mph at the stack height and for nine different wind directions. Smoke tracer tests were conducted to show air-flow streamlines, and wake effects and recirculation zones caused by nearby tree and building obstructions. Results of the smoke tests show that recirculation zones do not envelope the top of the stack. However, they also show that the wake of nearby trees or a wake caused by the upwind edge of the building does extend to heights above the stack. Results of the ground-level concentration measurements show values that agree favorably with those predicted by Gaussian dispersion models. The wind-tunnel results also were favorably compared to a full-scale case for which ground-level concentration data were available. 9 refs., 50 figs., 2 tabs.

46110 (UCRL–50007-87, pp. 57-61) **Evaluation of four models of personal air samplers.** Boyer, J.F.; Held, B.J. Lawrence Livermore National Lab., CA (USA). Jul 1988. In *Hazards Control Department annual technology review, 1987.* Order Number DE89002470/JAW. Available from NTIS, PC A07/MF A01.

The authors evaluated four makes of personal air samplers to determine which would best serve particular needs of field industrial hygienists and health technicians. The four makes of personal air samplers we studied are the duPont Alpha-1, the Gilian HFS 113A (UT), the MSA Flow-Lite, and the Sensidyne BDX 60. The tables in this report list the physical characteristics of each sampler and also give the results of the laboratory evaluations of each sampler's operating characteristics. The authors measured the noise levels generated by each sampler and inspected the required maintenance procedures. They also determined how long the pumps would operate without recharging or undergoing a change in flow rates and noise levels. With this information, field personnel should be able to choose the sampler that best fits the needs of a particular operation.

46111 (EUR–11755, pp. 36-57) **Aerosol metrology: aerodynamic and electrostatic techniques.** Prodi, V. (Bologna Univ. (IT). Ist. di Fisica). Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8712146–: Experts' meeting, 3-4 Dec 1987). In *Aerosol measurements and nuclear accidents: A reconsideration.* Order Number DE89908161/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

Aerosols play an ever increasing role in science, engineering and especially in industrial and environmental hygiene. They are being studied since a long time, but only recently the progress in aerosol instrumentation has made it possible to pose of aerosol metrology, especially the problem of absolute measurements, as based directly on measurements of fundamental quantities. On the basis of absolute measurements, the hierarchy of standards can be prepared and adequately disseminated. In the aerosol field, the quantities to be measured are mainly size, charge, density, and shape. In this paper a possible standardisation framework for aerosols is proposed, for the main physical quantities.

46112 (EUR–11755, pp. 58-84) **Virtual cascade impactors for the collection of radioactive atmospheric aerosols.** Berner, A. (Vienna Univ. (AT). Inst. fuer Experimentalphysik). Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8712146–: Experts' meeting, 3-4 Dec 1987). In *Aerosol measurements and nuclear accidents: A reconsideration.* Order Number DE89908161/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

Starting from impaction theory, the properties of virtual impaction stages are discussed and compared to classical impactors. Virtual impaction stages offer the benefit of sampling coarse particles without bouncing and reentrainment, but turbulent mixing affects the performance of virtual stages. Future research should concentrate on special configurations for reducing the effects of turbulent mixing. Virtual impaction stages for sampling radioactive aerosols are to be designed in regard of the analytical requirements, the purpose of the measurements, and the aerosol. Therefore, the aerosol components expected in radioactive aerosols are discussed on the background of the multimodal model, which relates the size distribution to the genesis and the history of the aerosol. Reference is made to recent data of the radioactive atmospheric aerosol.

46113 (EUR–11755, pp. 85-92) **New inertial and diffusional device (SDI 2000).** Boulaud, D. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (FR). Inst. de Protection et de Surete Nucleaire); Diouri, M.; Oujda Univ. Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8712146–: Experts' meeting, 3-4 Dec 1987). In *Aerosol measurements and nuclear accidents: A reconsideration.* Order Number DE89908161/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

Our aim has been to develop a new diffusional and Inertial Spectrometer (SDI 2000) able to cover a 2000-fold size range from 0.0075 μm to 15 μm and also to provide a mass size distribution corresponding to the true aerodynamic behavior of the aerosol measured. For this we chose to characterize aerosol inertial behavior for sizes sizes greater than 0.3 μm and aerosol diffusional behavior for sizes less than 0.3 μm. To achieve this, we combined in series a cascade impactor and a diffusion battery consisting of tubes arranged in parallel. The first step in analyzing mass size distribution of an aerosol involves inertial selection by collecting deposits at different stages of the impactor. The second step is a diffusional selection performed by collecting the deposits on filters placed downstream from the tubes where the aerosol is diffused through beds of glass beads.

(HL–89/1528). Order Number DE89636295/JAW. Available from NTIS (US Sales Only), PC A18/MF A01 - OSTI; INIS.

Projected timescales for the transport of radionuclides from an undisturbed underground nuclear waste repository to the surface are in the range of tens of thousands to millions of years. Over these timescales major natural and anthropogenic changes in climate can be expected. As part of the UK safety assessment programme time-dependent models of the repository environment are being developed and the Climatic Research Unit (CRU) has undertaken a study of relevant climatic change and climatic effects. In order to estimate the probable range succession and duration of major climate states likely to be experienced in the UK over the next 10^6 years the nature and mechanisms of climatic variations in the past are first reviewed. (Author).

46115 (NUREG/CP–0098-Vol.1, pp. 116-136) **Airborne concentrations of radioactive materials in severe accidents.** Ross, D.F. Jr. (Nuclear Regulatory Commission, Washington, DC (USA)); Denning, R.S. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.1: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 1–5.* Order Number DE89014647/JAW. Available from NTIS, PC A99/MF A01 - I.

Radioactive materials would be released to the containment building of a commercial nuclear reactor during each of the stages of a severe accident. Results of analyses of two accident sequences are used to illustrate the magnitudes of these sources of radioactive materials, the resulting airborne mass concentrations, the characteristics of the airborne aerosols, the potential for vapor forms of radioactive materials, the effectiveness of engineered safety features in reducing airborne concentrations, and the release of radioactive materials to the environment. Ability to predict transport and deposition of radioactive materials is important to assessing the performance of containment safety features in severe accidents and in the development of accident management procedures to reduce the consequences of severe accidents.

46116 (NUREG/CP–0098-Vol.1, pp. 512-523) **Kinetic studies of the retention of radioactive gases by activated carbon adsorbers.** Friedrich, V. (Institute of Isotopes, Budapest (Hungary)). Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.1: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 1–5.* Order Number DE89014647/JAW. Available from NTIS, PC A99/MF A01 - I.

A bimolecular reaction model containing the physico-chemical parameters of the adsorption process has been developed to describe the kinetics of a continuously operating adsorption column. An analytical solution of the model was found for low inlet gas concentrations and a cascade-type numerical method was used for calculations at higher inlet concentrations. When calculating accumulation and break-through curves using the cascade method the results show a strong concentration dependence at higher inlet concentrations but with decreasing concentration the curves asymptotically tend to the curve calculated by the analytical solution which is not concentration-dependent. Adsorption and desorption rate constants (K_F and K_B) and active site concentration (A_o) were determined by fitting theoretical curves on experimentally measured break-through curves. The values of K_F, K_B, and A_o were $3x10^3$ cm^3 mol^{-1} s^{-1}, $2.5x10^{-4}$ s^{-1} and $2.3x10^{-3}$ mol cm^{-3}, respectively, for the system composed of methyl-iodine vapor as adsorbate and granuled activated carbon as adsorbent. Adsorption isotherms measured under dynamic conditions and at various temperatures were of Langmuir-type. From the temperature-dependence of the kinetic parameters the activation energy was calculated by the help of the Arrhenius-equation and the process was found exotherm with an activation energy of 67 KJ mol^{-1} (16 kcal mol^{-1}).

46117 (NUREG/CP–0098-Vol.2, pp. 847-856) **Development, performance, and application of an advanced isokinetic stack sampling system.** Kurz, J.L. (Kurz Instruments Inc., Monterey, CA (USA)); Ramey, T.C. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

Substantial improvements in particulate isokinetic sample collection have been achieved. The paper has four major sections. First, unique thermal mass flow sensor technology indispensable to a high performance, continuous and automatic isokinetic sampling is introduced. Secondly, new sample nozzle design practices are discussed. Thirdly, empirical particle loss test results of ANSI-13.1 sample nozzles versus Kurz sample nozzles are published, and discussed. Finally, new particle loss calculation software useful in the design of sample withdrawal nozzles and manifolds is discussed. The authors conclude that existing DOE, NRC, EPA, ANSI, ASME, specifications for sampling nozzles are deficient, and suggest that new specifications be based on particle loss performance, i.e. nozzle shall successfully collect 30% of 15 micron particles, etc.

46118 (NUREG/CP–0098-Vol.2, pp. 879-895) **Catalytic oxidation of tritium and tritiated hydrocarbons in air and argon and adsorption of tritiated water on type 3A molecular sieves.** Qidong, Li (Fudan Univ., Shanghai (China)); Shungquing, Yuan; Changzhou, Ye; Kuidong, Zhoa; Ruihua, Xi; Bokang, Wu; Zuoshi, Liu. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

For the tritium removal system using catalytic oxidation, an efficient catalyst was developed at Fudan University. Several dozens of catalysts prepared in our laboratory have been tested and 0.6% Pd/Al_2O_3 catalyst was found to be the most promising one. This catalyst can give a quite satisfactory decontamination factor when operated at 160°C for ^3H in air, and at 400°C for tritiated hydrocarbons. Permissible discharge concentration can be achieved when the tritium-air gas mixture passes through the catalyst bed only once. The catalytic kinetic characteristics have been studied. Such as, fractional conversion, reaction order, reaction rate coefficient, activation energy, etc. In addition, adsorption dynamics of the 3A molecular sieve was studied. In the test, tritiated water vapor was used as the inlet gas. The result shows that the adsorption capacity was found to be 7.1 m mole/me (0.14g tritiated water vapor /g molecular sieve); the maximum adsorption capacity is dependent on temperature but not on flow velocity. And the result shows also that the adsorption mechanism of type 3A molecular sieve is an isotopic exchange process of H/T and the dryness of molecular sieve has no effect on adsorption capacity.

46119 (NUREG/CP–0098-Vol.2, pp. 973-983) **General correlation of DOP penetration with face velocity as a function of particle size using the FTS-200.** Pierce, M. (Hollingsworth and Vose Company, West Groton, MA (USA)); Guimond, R.; Lifshutz, N. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

The FTS-200 is a flat media filtration test stand build by TSI, Inc. of St. Paul, Minnesota. The test stand incorporates: (1) aerosol generation by atomization and evaporation techniques, (2) particle size selection by electrostatic classification and, (3) particle counting using a condensation nucleus counter (CNC). The stand is capable of accurately determining filtration efficiencies as high as 99.99999% for narrow particle size fractions in the diameter range of 0.05 to 0.4 microns. In addition, it measures the pressure drop across the flat media samples at accurately determined face velocities ranging from 0.5 to 15.0 cm/sec. A study was carried out measuring DOP penetration on a broad series of flat filtration media samples at various particle sizes and face velocities. The sampling

consisted of both commercial HEPA and ULPA media as well as binderless handsheets prepared from individual grades of microfiber glass. The effects of face velocity on the most penetrating particle size were studied. In this paper we present a useful correlation between DOP penetration and relative face velocity, utilizing particle size as a parameter. Similar correlations relating 'alpha' and 'figure of merit' rating to relative face velocity are described. Finally, we explore the use of these correlations as predictors of DOP penetration and most penetrating particle size at application face velocities, and their impact on filter design and media selection.

46120 (NUREG/CP–0098-Vol.2, pp. 1109-1116) **Multitubular option in adsorbent carbon filter unit design.** Fielding, G. (Hughes Associates, Inc., Wheaton, MD (USA)). Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

The design and performance characteristics are calculated and compared for monotubular, multitubular, and flat-bed adsorbent carbon filter units. A pentatubular unit appears to have outstanding characteristics.

46121 (NUREG/CP–0098-Vol.2, pp. 1284-1295) **Fire source term modeling using the FIRIN code.** Ballinger, M.Y. (Pacific Northwest Laboratory, Richland, WA (USA)); Owczarski, P.C. Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research; Harvard Univ., Boston, MA (USA). Harvard Air Cleaning Lab. May 1989. DOE Contract AC06-76RL01830. (CONF-880815–Vol.2: 20. DOE/NRC nuclear air cleaning conference, 22-25 Aug 1988). In *Proceedings of the 20th DOE/NRC nuclear air cleaning conference. Sessions 6–15.* Order Number DE89014648/JAW. Available from NTIS, PC A99/MF A01 - I.

The source term, or amount of radioactive material that challenges the air cleaning components during potential accidents in nuclear fuel cycle facilities, must be estimated to calculate the release of contaminants to the environment. The US Nuclear Regulatory Commission has sponsored a research program to better estimate the source term from several types of accidents. The most concentrated work has been done on fires, resulting in the development of FIRIN, a compartment fire code that estimates the release and distribution of radioactive materials within a room from fires involving radioactive materials. FIRIN relies on a set of subroutines to calculate quantity and size distribution of airborne radioactive material during a fire. These subroutines are identified with mechanisms of release such as pressurized releases of heated containers of radioactive materials or burning of contaminated combustibles. The main body of the code supplies factors that influence the source term to these subroutines. Examples of parameters supplied are fire burn rate, combustion product generation, heat and mass transfer, and fluid flow parameters. The code also takes into account depletion of airborne particles resulting from gravity settling, Brownian diffusion, diffusiophoresis, and thermophoresis.

5005 Site Resource and Use Studies

46122 (EGG–2564) **Environmental monitoring for EG and G Idaho facilities at at the Idaho National Engineering Laboratory: Annual report, 1988.** Tkachyk, J.W.; Wright, K.C.; Ritter, P.D.; Wilhelmsen, R.N.; Heileson, W.M. EG and G Idaho, Inc., Idaho Falls, ID (USA). Aug 1989. 65p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE89015210/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report describes the 1988 environmental monitoring activities of the Environmental Monitoring Unit of EG and G-operated facilities at the Idaho National Engineering Laboratory (INEL). The major facilities monitored include the Radioactive Waste Management Complex, the Waste Experimental Reduction Facility, the Mixed Waste Storage Facility, and two surplus facilities. Additional monitoring activities performed by Environmental Monitoring are also discussed, including preliminary radiological characterization of other facilities, drinking water monitoring, nonradiological liquid effluent monitoring, subsurface investigations, and data management. The primary purposes of monitoring are to evaluate environmental conditions and to provide information, in compliance with applicable regulations and interpreted as necessary, for ensuring protection of personnel, the public, and the environment. This report also compares 1988 environmental monitoring data with derived concentration guides and with data from previous years. This report also presents selected results of sampling performed by the Radiological and Environmental Sciences Laboratory and by the United States Geological Survey. 24 refs., 48 figs., 15 tabs.

46123 (ETDE/CA-MS–102) **The common eider (Somateria mollissima sedentaria) of eastern Hudson Bay. A survey of nest colonies and Inuit ecological knowledge.** Nakashima, D.J.; Murray, D.J. Department of Energy, Mines and Resources, Ottawa, ON (Canada). 1988. V (MICROLOG–89-02451). Available from Energy, Mines and Resources Canada, Communications Branch, 580 Booth St., Ottawa, ON, CAN K1A 0E4; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In response to the threat posed by oil exploration in central Hudson Bay, this study was designed to provide information on the numbers, breeding distribution and ecology of common eiders in the eastern part of the Bay. The east shore of the Bay is of particular concern as the prevailing west and northwest winds render it the most susceptible to oil damage. The results of this study establish a quantitative basis for monitoring the eider population and provide baseline ecological information for appropriate oil spill response planning. Seven subregions were selected for intensive ground surveys, three in nearshore archipelagos and four in the offshore. From the results, the estimated size of the breeding population of the Hudson Bay eider, from the Akulivik area in the north to the junction of Hudson and James Bays in the south, to be about 41,490 breeding pairs. Although there are some indications that the breeding population may have declined in some nearshore areas, it appears that as a whole the sedentaria population is healthy and stable. Data on the eider's ecology were collected during interviews with 41 Inuit from local communities. Extensive information was compiled on eider taxonomy, biogeography, behavior, diet, life history, and breeding and wintering ecology. 35 refs., 21 figs., 14 tabs.

46124 (INIS-mf–11490) **Proceedings of the national workshop on the use of ^{137}Cs to measure erosion.** Soil Conservation Service of New South Wales, Sydney (Australia). Jan 1989. 24p. (CONF-8809383–: National workshop on the use of ^{137}Cs to measure erosion, 20 Sep 1988). Order Number DE89635091/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The workshop was concerned with the use and development of Cs-137 techniques of measuring erosion. The overall outcome of the workshop was a view that it is inappropriate at this time to conduct a comprehensive national assessment of soil erosion using the Caesium-137 technique, but it is appropriate to conduct a reconnaissance survey which would establish/confirm reference levels of Cs^{137} deposition across Australia, establish, at a statistically viable level, the capability to confirm at least large differences in Cs^{137} concentration, and build up a more comprehensive picture of Cs^{137} and its association with soil movement in the Australian landscape.

46125 (INIS-mf–11490, pp. 4) **Cs-137 activity as an index of soil movement under a grazed native pasture at Narayen,**

Queensland. Bridge, B.J. (Commonwealth Scientific and Industrial Research Organization, Toowoomba (Australia). Queensland Wheat Research Institute); O'Leary, B.M.; Mott, J.J. Soil Conservation Service of New South Wales, Sydney (Australia). Jan 1989. (CONF-8809383--: National workshop on the use of ^{137}Cs to measure erosion, 20 Sep 1988). In *Proceedings of the national workshop on the use of ^{137}Cs to measure erosion.* Order Number DE89635091/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Cs-137 measurements for the 0-10 cm soil depth are presented, together with the paddock slope profile. The trend for lower activities in the region of maximum slope and the high activity at the bottom of the slope is apparent. However, the variability is considerable and this makes quantitative assessment difficult. The study used a Li-drifted Ge 12% detector which allowed only one sample per day to be counted. This is a major problem with the Cs-137 technique.

46126 (INIS-mf--11490, pp. 4) **Using Cs-137 to assess sheet erosion in Western Australia.** McFarlane, D.J. (Western Australia Dept. of Agriculture, Perth (Australia). Div. of Water Resource Management); Loughran, R.J.; Campbell, B.L. Soil Conservation Service of New South Wales, Sydney (Australia). Jan 1989. (CONF-8809383--: National workshop on the use of ^{137}Cs to measure erosion, 20 Sep 1988). In *Proceedings of the national workshop on the use of ^{137}Cs to measure erosion.* Order Number DE89635091/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The Cs-137 technique represents the only feasible method whereby sheet erosion is likely to be measured in Western Australia given the expense of building, equipping and monitoring stream gauging stations and the difficulties in detecting small but significant changes in soil levels on sites subject to wind erosion. A pilot study in 1987 used a stratified sampling technique to assess sheet erosion on representative hillslopes. There are possible problems in using the Cs-137 technique in Western Australia due to poor labelling of non-wetting soils, due to poor retention by very sandy soils, due to the selective removal of dust particles and due to wind erosion adding Cs-137 to input sites. Lateritic gravel stones may also need to be crushed and added to the samples for analysis. Some of these problems may be better understood when the results of the pilot survey have been analysed.

46127 (INIS-mf--11490, pp. 2) **Variability of caesium-137 in soils.** Perrens, S.J. (Dames and Moore, Sydney (Australia)); Norris, V. Soil Conservation Service of New South Wales, Sydney (Australia). Jan 1989. (CONF-8809383--: National workshop on the use of ^{137}Cs to measure erosion, 20 Sep 1988). In *Proceedings of the national workshop on the use of ^{137}Cs to measure erosion.* Order Number DE89635091/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A study was undertaken to assess the variability of ^{137}Cs in a red-brown earth, located 10 kilometres north-east of North Star, northern NSW, in gently undulating dryland farming country. Caesium-137 was determined by gamma spectroscopy using a Ge-Li detector and multi-channel analyser. The requirement for taking and analysing large numbers of samples in order to obtain sufficient confidence in estimates of erosion rate poses a serious limitation on the widespread use of ^{137}Cs measurement for this purpose.

46129 (CONF-881054--Vol.1, pp. 117-127) **Use of cone penetration systems for remedial investigation of waste sites.** Taylor, L.R. (Earth Technology Corp. (USA)); Berzins, N. Analysas Corp., Oak Ridge, TN (USA). 1988. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 1.* Order Number DE89014700/JAW. Available from NTIS, PC A15/MF A01.

The Cone Penetration Test (CPT) and other in situ tests and sampling approaches related to the basic CPT have been used during site characterization studies and remedial investigations at waste sites. In addition to deploying standard electronic cone penetrometers, CPT systems can be used to deploy a wide variety of other in situ testing devices and sampling probes to gather subsurface information at waste sites. The use of these tools can provide a safe, efficient and cost-effective means of assessing a broad range of subsurface soil and contaminant conditions including stratigraphy, soil types, engineering properties, contaminant migration and hydrogeologic conditions. This paper presents a description and discussion of the use of electronic friction-cone penetrometers and other in situ testing tools including self-grouting cone penetrometers, soil gas sampling probes, groundwater sampling probes and other devices. The benefits of utilizing CPT-based techniques during the initial stages of RIs are discussed with respect to cost, productivity, health and safety concerns, and quality of data.

46130 (CONF-881054--Vol.2, pp. 385-396) **Case history: Air Force base jet fuel spill remedial investigation, feasibility study, and remedial design.** McIntyre, G.T.; McElroy, W.J. Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA); Analysas Corp., Oak Ridge, TN (USA). 1988. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 2.* Order Number DE89014701/JAW. Available from NTIS, PC A13/MF A01.

In May 1982, Air Force base personnel discovered JP-4 fuel leaking from an underground purge line near Pump Station 9. Installation Restoration Program (IRP) investigations in November 1984 confirmed JP-4 was floating on the water table in an area now identified as Site 9. In May 1986, work was initiated under the Martin Marietta Energy Systems Hazardous Waste Remedial Action Program for a remedial investigation/feasibility study (RI/FS) to culminate in the selection and conceptual design of remedial action for the area. The RI involved the installation of 13 shallow borings and temporary well points to evaluate the location and extent of the floating JP-4 plume. Four shallow and two deep monitor wells were installed to evaluate the location, extent, and magnitude of dissolved hydrocarbon contamination. Also included in the RI were ground water, soil, surface water, sediment, and JP-4 fingerprinting sampling. The RI located a floating JP-4 plume covering approximately 2 acres and a dissolved hydrocarbon plume. FS preparation progressed in a series of IRP-required stages. Control measures screened for feasibility and applicability were used to develop remedial action alternatives. Evaluation of detailed alternatives encompassed engineering feasibility, public health impacts, environmental effects, regulatory requirements, and present worth costs. The remedial action selected includes JP-4 and ground water recovery by two wells fitted with dual pumping recovery systems, ground water treatment by air stripping, discharge of treated ground water through an onsite infiltration trench, and collection and management of recovered JP-4. The final design is underway and will be completed in October 1988.

46131 (CONF-881054--Vol.2, pp. 575-586) **Evaluation of methyl ethyl ketone (2-butanone) contamination at the Massachusetts Military Reservation.** Haase, C.S. (E. C. Jordan Co., Oak Ridge, TN (USA)); Wallin, B.K.; Miller, M.S. Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA); Analysas Corp., Oak

Ridge, TN (USA). 1988. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 2.* Order Number DE89014701/JAW. Available from NTIS, PC A13/MF A01.

Methyl ethyl ketone (MEK or 2-butanone) has been found in a majority of wells installed in the Mashpee Study Area as part of the Task 5 (Mashpee Groundwater Study) Installation Restoration Program activities at the Massachusetts Military Reservation, Cape Cod, Massachusetts. The concentration and occurrence of MEK within the wells of the study area, however, exhibit significant spatial and temporal variability for six sampling rounds conducted between May 1987 and February 1988. Correlation of MEK occurrence and concentrations for repeat samplings from wells is typically poor. Such observations have raised the question as to whether MEK is actually present in groundwater at the Mashpee Study Area. Data validation, quality assurance/quality control audits, special samplings using modified techniques, and review and modification of analytical methods for MEK have been undertaken to evaluate the MEK data. Results from these activities suggest that much, if not all, of the MEK occurrences detected in ground waters within the study area may be false positives. Such false positives could have resulted from (1) possible contamination during sample collection, (2) possible laboratory contamination, and (3) inherent lack of sensitivity for MEK in the analytical techniques employed.

46132 (CONF-881054–Vol.2, pp. 587-598) **Multi-faceted approach to site characterization at Volk Field ANGB (Air National Guard Base).** Bonner, R.S. (Engineering-Science, Inc. (USA)); Duncan, W.J. Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA); Analysas Corp., Oak Ridge, TN (USA). 1988. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 2.* Order Number DE89014701/JAW. Available from NTIS, PC A13/MF A01.

Eight sites at Volf Field Air National Guard Base (ANGB), Camp Douglas, WI and affiliated Hardwood Range were identified as being, or potentially being, sources of environmental contamination. These facilities are located in South Central Wisconsin within an area known as the driftless zone. The base is no gently undulating land surrounding sandstone buttes. The sites are underlain by unconsolidated sands and clays (Pleistocene lake deposits) and sandstones (Cambrian). The sites include one bulk fuels storage area, one PCB disposal area, one munitions disposal area, three former landfills and a fire training area. The multi-faceted approach used to conduct the investigations included soil-gas surveys, geophysical surveys, soil sampling and analysis, ground and surface water analyses, slug tests and an aquifer pumping test. The work at the Fire Training Area provides an opportunity to illustrate the usefulness of multiple techniques in performing a remedial investigation. A soil-gas survey delineated an area of probable solvent and fuel contamination. Drilling and monitoring well installation verified the presence of contaminants and indicated that ground water was contaminated with trichloroethylene, benzene, toluene, and xylenes beyond the plume boundary estimated by the soil-gas survey. Slug and aquifer tests were conducted to evaluate aquifer properties. The work to date tentatively identified the need for additional studies to characterize the extent of contamination at this and five other sites.

46133 (CONF-8907123–1) **Direct sampling ion trap mass spectrometry for the rapid determination of volatile organics in environmental matrices.** Buchanan, M.V.; Wise, M.B.; Guerin, M.R. Oak Ridge National Lab., TN (USA). [1989]. 10p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. From EPA waste testing and quality assurance symposium; 24-28 Jul 1989. Order Number DE89015358/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Analytical methods are currently being developed for the rapid determination of part-per-billion or lower levels of volatile organics in water, soil, air, and oil samples using direct sampling in combination with a rf quadrupole ion trap mass spectrometer (ITMS). Features of the ITMS which are important to the success of these applications include the ability to perform selective chemical ionization, high efficiency collision induced dissociation (MS/MS) experiments, excellent instrument reliability and tolerance to relatively high operating pressures. Excellent detection limits, linearity of response, and reproducibility have been demonstrated for the determination of volatiles in water, soil, and air. Because no chromatography is used, sample turn-around is typically less than 5 minutes. Direct sampling is accomplished with a split-open-split capillary restrictor interface which has been designed to accept a wide variety of sampling devices. Volatiles in water can be determined without any sample preparation simply by direct purge with helium into the mass spectrometer sample interface. A helium flow rate of approximately 100 ml/min through a sparging device enables reproducible purging of volatiles from a 15 ml water sample in less than 3 minutes. Soil samples are prepared by adding 15 ml of distilled water to 5 g of soil to form a slurry. Chlorinated solvents have been successfully purged from samples of used motor oil without any sample preparation. Volatile organics in air may be determined either by direct sampling or by preconcentration on a resin trap followed by direct thermal desorption into the ITMS. Direct air sampling has an estimated detection limit of approximately 1 ppB, while preconcentration is effective for ppT or lower levels of constituents. 5 figs.

46134 (CONF-8909170–1) **Environmental and plant effects of sewage sludge application to forests and pastures.** Van Miegroet, H.; Boston, H.L.; Johnson, D.W. Oak Ridge National Lab., TN (USA). [1989]. 27p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. From 12. annual Madison waste conference; 20-21 Sep 1989. Order Number DE89015896/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Digested sewage sludge was applied to pastures and tree plantations at 19 to 44 Mg/ha (dry weight) as part of a municipal sludge disposal program. The sludge had low concentrations of heavy metals and traces of ^{137}Cs and ^{60}Co. Monitoring of soils, soil solutions, and runoff indicated that N, P, heavy metals, and radionuclides were largely retained in the upper 15cm of the soil. Soil solutions had elevated NO_3^- concentrations often >100 mg/L, but no significant increases in groundwater NO_3^- were found during the first year. Runoff from active sites had elevated concentrations of NO_3^- (20–30 mg/L), soluble P (1 mg/L), BOD_5 (5–30 mg/L), and fecal coliform (up to 14,000 colonies per 100 ml), not unlike runoff from pastures with cattle. Enrichment of organic N (2 times), available (inorganic) N (5 to 10 times), and Bray-P in the upper soils persisted for several years following sludge application. Sludge increased vegetation N concentrations from 1.5% to 2.3% and P concentrations from 0.16% to 0.31%. With the exception of Zn, heavy metals did not accumulate substantially in the vegetation. The sludge addition increased the survival and growth of sycamore (Platanus occidentalis L.). For a loblolly pine (Pinus taeda L.) plantation future growth improvements are expected based on elevated foliar N concentrations. 37 refs., 3 figs., 7 tabs.

46135 (CPS–EPS9/HA/1) **Manual for the management of wastes containing polychlorinated biphenyls (PCBs).** Environment Canada, Ottawa, ON (Canada). Conservation and Protection. 1987. 93p. (MICROLOG–87-02651). Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This manual presents recommended practices for the management of wastes containing polychlorinated biphenyls (PCBs). It covers procedures for decommissioning and decontamination, storage, transportation, disposal, labelling and recordkeeping, and emergency preparedness for PCB-contaminated equipment and containers, as well as for solid and liquid wastes containing more than 50 ppM of PCBs. Summaries of Canadian federal and provincial regulations, and requirements for incineration and for high efficiency boilers, are also included. 18 refs., 9 figs., 4 tabs.

46136 (CPS–SPE9/HA/1) **Manual for the management of wastes containing polychlorinated biphenyls (PCBs).** Environment Canada, Ottawa, ON (Canada). Conservation and Protection. 1987. 94p. (In French). (MICROLOG–87-02652). Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This manual presents recommended practices for the management of wastes containing polychlorinated biphenyls (PCBs). It

covers procedures for decommissioning and decontamination, storage, transportation, disposal, labelling and recordkeeping, and emergency preparedness for PCB-contaminated equipment and containers, as well as for solid and liquid wastes containing more than 50 ppM of PCBs. Summaries of Canadian federal and provincial regulations, and requirements for incineration and for high efficiency boilers, are also included. 18 refs., 9 figs., 4 tabs.

46137 (DOE/RL–89-11) **Toxic chemical release inventory: Superfund Amendments Reauthorization Act, Title 3, Section 313.** USDOE Richland Operations Office, WA (USA). Jul 1989. 79p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. Order Number DE89016244/JAW. Available from NTIS, PC A05/MF A01 - OSTI.

Toxic chemical release information contained in this document was derived using process flow diagrams and material balances, process chemistry and emissions treatment technology, hazardous materials inventories, environmental permits, hazardous materials release reports, hazardous waste shipment papers, and sample analysis or monitoring data where available.

46138 (ORNL–6526/R5) **Environmental Regulatory Update Table, June 1989.** Houlberg, L.M.; Langston, M.E.; Nikbakht, A.; Salk, M.S. Oak Ridge National Lab., TN (USA). Jul 1989. 103p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89015683/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Environmental Sciences Division Publication No. 3248.

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated each month with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

46139 (ORNL–6526/R6) **Environmental Regulatory Update Table, July 1989.** Houlberg, L.M.; Langston, M.E.; Nikbakht, A.; Salk, M.S. Oak Ridge National Lab., TN (USA). Aug 1989. 105p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC05-84OR21400. Order Number DE89015684/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

46140 (ORNL/TM–10724) **Removal of volatile organic compounds from groundwater: A survey of the technologies.** Singh, S.P.; Counce, R.M. Oak Ridge National Lab., TN (USA). May 1989. 65p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC05-84OR21400. Order Number DE89015653/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Groundwater contaminated with volatile organic compounds (VOCs) is being encountered with greater frequency. Since the natural degradation of these contaminants is very slow, artificial means of removing the organic compounds from the groundwater are required to prevent further deterioration of the aquifer. The technologies which have been employed for the removal of VOCs from groundwater are air stripping, biological treatment, carbon adsorption, chemical oxidation, and membrane separation. This report provides a review of the status of these technologies with particular emphasis on air stripping with emissions control. 72 refs., 6 figs., 7 tabs.

46141 (PB–89-193395/XAB) **Soil chemistry and phosphorus retention capacity of North Carolina coastal plain swamps receiving sewage effluent.** Richardson, C.J.; Walbridge, M.R.; Burns, A. North Carolina Water Resources Research Inst., Raleigh, NC (USA). Nov 1988. 101p. (UNC-WRRI–88-241). Available from NTIS, PC A06/MF A01.

Portions of this document are not fully legible.

Several hundred freshwater swamps in North Carolina currently receive municipal waste-water inputs. In the study researchers examined three Coastal Plain wetlands to (1) characterize their soil chemical properties, (2) determine short-term and long-term effects of effluent additions on soil chemistry, (3) estimate the phosphorus sorption capacities of these swamp soils and determine the relationship between P sorption capacity and soil chemistry, and (4) develop a predictive index to evaluate the P sorption potentials of other N.C. Coastal Plain swamps.

46142 (PB–89-197768/XAB) **Biological treatment of leachate from a Superfund site.** Opatken, E.J.; Howard, H.K.; Bond, J.J. Environmental Protection Agency, Cincinnati, OH (USA). Hazardous Waste Engineering Research Lab. Feb 1989. 10p. (EPA–600/J-89/001). Available from NTIS, PC A02/MF A01.

Pub. in Environmental Progress, Vol. 8, No. 1, 12-18(Feb 1989).

Studies were completed on treating a leachate from New Lyme, Ohio. The leachate was transported to Cincinnati, Ohio, where a pilot-sized rotating biological contactor (RBC) was used for a treatment evaluation. The biomass was developed on the RBC discs with primary effluent from the City of Cincinnati's Mill Creek Sewage Treatment Facility. Experiments were then conducted to determine the effectiveness of treating a hazardous waste leachate and to provide information on the following: the rate of organics removal; the final effluent quality; the fate of priority pollutants and specific organic compounds; and the loss of volatiles via stripping in the RBC. The paper reports on the results from these experiments and the applicability of an RBC to treat a hazardous-waste leachate from a Superfund site.

46143 (AECL–9350) **COSMOS-S/D assessment code complex for a SLB repository at CRNL.** Jarvis, R.G.; Adam, R.Y.; Bretzlaff, C.I.; Laurens, J.M.; Wilkinson, S.R. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Dec 1986. 10p. (CONF-8609350–: 2. international conference on nuclear waste management, Sep 1986). Order Number DE89635083/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The COSMOS-S/D code complex is being developed by the Waste Management Technology Division at CRNL. It models leaching of radionuclides from containment, their migration through vault materials and the ground, their dispersion in surface waters and the atmosphere, and eventual irradiation of man. It is being used at present for safety assessment of a proposed shallow Land Burial Facility, but is is suitable for a wide range of shallow land burial problems. Some examples of its output are given. The scenarios were chosen to be rather conservative, in order to demonstrate the various sections of the code.

In *Co-ordinated research programme on nuclear techniques for toxic elements in foodstuffs. Report on the second research co-ordination meeting, Beijing, People's Republic of China, 19-22 April 1988.* Order Number DE89636003/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

Published in summary form only.

46145 (IPEN-PUB–241) **Radionuclide migration studies in soil.** Marumo, J.T. Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). Jan 1989. 27p. (In Portuguese). Order Number DE89636251/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

In this work a brief description about retention and migration parameters of radionuclides in soil, including main methods to determine the distribution coefficient (K) are given. Some of several factors that can act on the migration are also mentioned. (author).

46146 (NSS/G–103) **Chemical and microbiological effects in the near field: current status.** Ewart, F.T.; Pugh, S.Y.R.; Wisbey, S.J.; Woodwark, D.R. United Kingdom Nirex, Ltd., Harwell (UK). Dec 1988. 44p. (HL–89/1077). Order Number DE89636252/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The radionuclide inventory of a radioactive waste repository, influenced by the chemical conditions in the near-field, determines the source term for radionuclides entering the geosphere. The research described in this report is focussed on providing the information necessary to quantify this source term. The processes which interact to determine near field behaviour over a long period of time are complex and a simplified representation is required for radiological assessment modelling. The assumptions made in formulating the near field assessment methodology are discussed and justified in this report. The techniques for acquiring the necessary large body of data for a wide range of relevant radionuclides are also described and the values used in the CASCADE I exercise are given. (author).

46147 (ORNL/RASA–88/17) **Results of the radiological survey at 80 Industrial Road, Lodi, New Jersey (LJ061).** Foley, R.D.; Carrier, R.F.; Floyd, L.M.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Jul 1989. 21p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89016235/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Maywood Chemical Works (MCW) of Maywood, New Jersey, generated process wastes and residues associated with the production and refining of thorium and thorium compounds from monazite ores from 1916 to 1956. MCW supplied rare earth metals and thorium compounds to the Atomic Energy Commission and various other government agencies from the late 1940s to the mid-1950s. Area residents used the sandlike waste from this thorium extraction process mixed with tea and cocoa leaves as mulch in their yards. Some of these contaminated wastes were also eroded from the site into Lodi Brook. At the request of the US Department of Energy (DOE), a group from Oak Ridge National Laboratory conducts investigative radiological surveys of properties in the vicinity of MCW to determine whether a property is contaminated with radioactive residues, principally ^{232}Th, derived from the MCW site. The survey typically includes direct measurement of gamma radiation levels and soil sampling for radionuclide analyses. The survey of this site, 80 Industrial Road, Lodi, New Jersey (LJ061), was conducted during 1985 and 1986. Results of the survey demonstrated radionuclide concentrations in excess of DOE remedial action criteria, primarily from the ^{232}Th decay chain, with some contamination from ^{226}Ra. The radionuclide distributions are typical of the type of material originating from the MCW site. 5 refs., 11 figs., 3 tabs.

46148 (ORNL/RASA–88/57) **Results of the radiological survey at 99 Garibaldi Avenue, Lodi, New Jersey (LJ064).** Foley, R.D.; Floyd, L.M.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Jul 1989. 23p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89016038/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

46153 (PB–89-204820/XAB) **Superfund Record of Decision (EPA Region 7): Fulbright/Sac River Landfill, Missouri (first remedial action), September 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 Sep 1988. 43p. (EPA/ROD/R–07-88/030). Available from NTIS, PC A03/MF A01.

The Fulbright and Sac River Landfills are located just north of the City of Springfield, Missouri, in a semirural area. The landfills were operated by the city for the disposal of municipal and industrial solid wastes. The site, however, could endanger human health or the environment in the future through exposure of the industrial wastes through erosion of the landfill cover. The selected remedial action for this site includes: removal of the drum and drum remnants found in the sinkhole and associated trench east of the Fulbright Landfill; sampling the removed contents to determine hazardous characteristics; proper offsite treatment or disposal.

46154 (AD-A–208201/4/XAB) **Environmental atlas of the Bering Sea. Final report.** Comiskey, A.L.; Ostrom, J.E. Northern Technical Services, Inc., Anchorage, AK (USA). Oct 1988. 187p. Available from NTIS, PC A09/MF A01.

This atlas contains oceanographic, meteorologic, and air-sea interface information. The information is a composite of traditional climatological and oceanographic data interspersed with non-traditional empirical information useful to Coast Guard operations. Some unique subjects are discussed such as ship operations in first year ice and flying conditions over water. The atlas is also unique in that subjects are discussed both briefly (first portion of atlas) and extensively (second portion) to accommodate readers with different levels of interest. Contents–Physical Geography; Factors Affecting Oil Spill Transport; Factors Affecting Oil Spill Containment or Mitigation Efforts; Oceanography; Climatology and Meteorology; Sea Ice; Ship and Equipment Operations in First Year Ice; Appendices: Sunrise/Sunset Tables, Storm Surge Forecast Procedures; Glossary of Ice Terms.

46155 (MNR/FB–88-12) **Summary of fish population data from Sipiwesk and Cross Lakes, 1987.** Manitoba Dept. of Natural Resources, Winnipeg, MB (Canada). Fisheries Branch. 1987. 101p. (MICROLOG–89-02359). Available from Manitoba Natural Resources, Public Information Services, 1495 St. James St., PO Box 22, Winnipeg, MB, CAN R3H 0W9; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Cross and Sipiwesk lakes are located on the Upper Nelson River System. Cross Lake is immediately downstream of Manitoba Hydro's Jenpeg Generating Station while Sipiwesk Lake is just downstream of Cross Lake. Lake Winnipeg Regulation and the operation of Jenpeg Generating Station both have an influence on water level and flow conditions through these two lakes. In 1985 an ecological monitoring program was initiated to investigate and document the possible impact of hydro development on fish populations within the Churchill River Diversion and Nelson River Systems. Cross and Sipiwesk lakes were two of the six lakes chosen for annual sampling. The purpose of this report is to present the fish population data collected from Cross and Sipiwesk lakes in 1987 in a form that will make it readily and more easily available for future reference. 4 refs., 35 figs., 47 tabs.

46156 (MNR/FB–88-15) **Fish population data from Split and Stephens lakes, 1987.** Hagenson, I. Manitoba Dept. of Natural Resources, Winnipeg, MB (Canada). Fisheries Branch. 1988. 79p. (MICROLOG–89-03340). Available from Manitoba Natural Resources, Public Information Services, 1495 St. James St., PO Box 22, Winnipeg, MB, CAN R3H 0W9; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The data presented in this report were collected as part of an ecological monitoring project to ascertain and evaluate current impacts and long-term effects of existing and planned hydroelectric developments in northern Manitoba on abiotic and biotic environments in affected lakes and watercourses. The function of this report is to provide baseline data on the fish populations of Split and Stephens lakes which were sampled in the summer of 1987. The collected data are summarized with special emphasis on the relative abundance of each species and the effects of various mesh sizes on fish species. Growth rates, age composition, maturity, survival

and mortality rates of whitefish (Coregonus clupeaformis), walleye (stizostedion vitreum vitreum), sauger (Stizostedion canadense) and northern pike (Esox lucius) are also described, in order to provide a data base for future management. 3 refs., 26 figs., 33 tabs.

Norsk Hydrologisk Komite, Oslo (Norway). 1987. (CONF-870577–: International symposium on acidification and water pathways, 4-8 May 1987). In *Acidification and water pathways. Vol. 1. Proceedings of International symposium on acidification and water pathways, Bolkesjoe, 4-5 May 1987.* Order Number DE89766881/JAW. Available from NTIS (US Sales Only), PC A20/MF A01.

Surface waters in a generic series: river-peat bog-lacustrine waters are studied. The rain natural processes of these environments which determine the migration of typomorphic elements and the pathways of hydrochemical composition formation are distinguished. 4 tables, 11 references.

46158 (NEI-NO–82, pp. 79-90) **Effect of vegetation cover (pine forest vs. no vegetation) on atmospheric desposition and soil acidification.** Mulder, J.; Dobben, H.F. van; Visser, P.H.B. de; Booltink, H.W.G.; Breemen, N. van. Norsk Hydrologisk Komite, Oslo (Norway). 1987. (CONF-870577–: International symposium on acidification and water pathways, 4-8 May 1987). In *Acidification and water pathways. Vol. 1. Proceedings of International symposium on acidification and water pathways, Bolkesjoe, 4-5 May 1987.* Order Number DE89766881/JAW. Available from NTIS (US Sales Only), PC A20/MF A01.

The impact of a forest cover on total atmospheric acid load, internal soil acidification and the Al chemistry was studied at two adjacent driftsands, one with Scots Pine and one without vegetation. Soils are acidic, with low base cation contents, CEC and base saturation. Annual chemical budgets were estimated for a 1-year period from solute concentrations, amounts of precipitation and throughfall, calculated soil water fluxes, and measurements on litterfall and tree grovth. Annual (NH-4)-2SO-4 deposition was higher in the forest (2.0 kmol ha^{-1}) than on the bare sand (0.9 kmol ha -1). The total acid load was primarily due to NH-4 transformation, and was very high in the forest soil and considerably lower in the bare sand (6.2 and 3.0 kmol ha-1, respectively). Acid inputs were mainly neutralized by Al solubilization, giving high dissolevd Al concentrations (in the forest soil mean 1400 mmol (+)m^{-3}). Sulphate sorption was not observed. Soil solutions at the bare site were saturated with gibbsite at depths greater than a few cm below the soil surface. The forest soil solutions were undersaturated with gibbsite in the rootzone (0 to 40 cm) and only reached equilibrium with gibbsite at greater depth. Regulation of the Al activity by jurbanite must be excluded in our soils. 1 figure, 5 tabels, 18 references.

46159 (NEI-NO–82, pp. 291-301) **Adirondack lake system acidity: Differences between headwater and nonheadwater lakes.** Hunsaker, C.T.; Olson, R.J.; Carpenter, D.E. Norsk Hydrologisk Komite, Oslo (Norway). 1987. (CONF-870577–: International symposium on acidification and water pathways, 4-8 May 1987). In *Acidification and water pathways . Vol. 1. Proceedings of International symposium on acidification and water pathways, Bolkesjoe, 4-5 May 1987.* Order Number DE89766881/JAW. Available from NTIS (US Sales Only), PC A20/MF A01.

Surface water acidification may be caused or influenced by natural watershed processes and by anthropogenic activities. One portion of the U.S. National Acid Precipitation Assessment Program focused on lake acidity as related to natural and anthropogenic watershed attributes in the Adirondack region of New York. The objectives were to build a series of data sets for complex watershed systems that would complement those developed for headwater lake and analyze empirical relationships lake pH and watershed attributes for complex watershed system, to determine if different processes operate in headwater and noheadwater watersheds. Sixty-six watersheds systems (258 lakes) were studied, using chemistry data available for one-half of these lakes. Results show that headwater lakes had a slightly lower average pH (0.26 units) than nonheadwater lakes. Physical and chemical soil attributes were related to differences in lake acidity between headwater and nonheadwater lakes. 3 figures, 2 tables, 6 references.

46160 (OME–APIOS-1988) **Acid sensitivity of lakes in Ontario.** Ontario Ministry of the Environment, Toronto, ON (Canada). Acid Precipitation in Ontario Study. 1988. 27p. (In English and French). (MICROLOG–89-02261). Available from Ministry of the Environment. A.P.I.O.S. Coordination Office, 40 St. Clair Avenue West, 7th Floor, Toronto, ON, CAN M4V 1M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Ontario Ministry of the Environment conducts surveys to determine the sensitivity of Ontario lakes to acidic precipitation. This report presents a summary of the latest results of this survey and includes information on 6,467 lakes throughout the province. Lakes are arranged alphabetically by county or district, and a sensitivity index on a scale of 1 to 5 is given for each lake sampled. A summary table shows that 25.0% of the lakes were found to be not sensitive to acidification, and a further 17.2% had low vensitivity. Lakes classified as acidic represented 5.2% of the total and 15.7% were classified as extremely sensitive. 1 tab.

46161 (OME/WRB–DR84-2) **Macrophyte data from 46 southern Ontario soft-water lakes of varying pH.** Hitchin, G.G.; Wile, I.; Miller, G.E.; Yan, N.D. Ontario Ministry of the Environment, Toronto, ON (Canada). Water Resources Branch. [1989]. 153p. (MICROLOG–89-02129). Available from Ontario Ministry of the Environment, Public Information Office, 135 St. Clair Ave. West, Toronto, ON, CAN M4V 1P5; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

To determine the influence of lake acidification and trace metal contamination on aquatic plant communities, a survey was conducted of 46 lakes of varying pH and metal levels in southern Ontario. The occurrence, distribution and abundance of vascular and non-vascular aquatic macrophytes in these lakes is detailed in this report. Maps are also presented showing locations of all sampling transects. A total of 79 plant species were surveyed, 50 of which were vascular macrophytes, 23 aquatic mosses and 6 stoneworts. There was a positive relationship between maximum plant depth and water clarity. The range of depths of plant occurrence varied among species, generally resulting in a vertical zonation of species. Total plant cover in the 46 lakes appeared to be related to lake pH; plant cover exceeded 50% on proportionately more transects in the acidic lakes. 10 refs., 52 figs., 51 tabs.

46162 (PB–89-192983/XAB) **Population status of California sea otters.** Minnesota Univ., Minneapolis, MN (USA). Dept. of Ecology and Behavioral Biology. 30 Nov 1988. 394p. Available from NTIS, PC A17/MF A01.

See also PB–85-174035.

The main objective of the study was to develop a simulation model to facilitate analysis of the risk of oil spills to the threatened California sea otter population. Existing data on the dynamics and demography of the population were synthesized. The additional data needed for model development were collected through radiotelemetry studies of sea otters in Alaska and California. The simulation model contains four interrelated stochastic submodels: a short-term population model, a long-term population model, a sea otter distribution model, and a sea otter movement model. The report includes a detailed description of the model, the data on which it is based, and an operating manual.

46163 (AD-A–208109/9/XAB) **Influence of well casing composition on trace metals in ground water. Special report.** Hewitt, A.D. Cold Regions Research and Engineering Lab., Hanover, NH (USA). Apr 1989. 22p. (CRREL-SP–89-9). Available from NTIS, PC A03/MF A01.

These experiments determined the concentration dependence of trace inorganic priority pollutants (As, Cd and Pb) in ground water solutions exposed to polyvinylchloride (PVC), polytetrafluoroethylene (PTFE) and two types of stainless steel (SS304 and SS316). The

test design used a factorial screening matrix with two concentrations of metals (As-Cr-Pb, 50 and 10 micrograms/L; C/d, 10 and 2 micrograms/L), pH (5.8 and 7.7), and total organic carbon (natural and natural plus 5 mg/L humic acid) as variables. Samples containing well casings and controls without pipe sections were run as duplicates. Aliquots were removed from all of the solutions after 0.5,4,8,24 and 72 hours. Aqueous metal concentrations were determined by graphite furnace atomic absorption spectroscopy. The results showed PTFE to have no significant influence on the metals monitored under any of the groundwater conditions. Metal concentrations in ground water exposed to SS316 and SS304 had large random variances believed to be caused by surface oxidation of the stainless steel. PVC had a more active surface than PTFE in terms of both sorption of Pb and of Cd.

46164 (AD-A–208124/8/XAB) **Storage capacity evaluation for Craney Island expansion alternatives. Final report.** Poindexter-Rollings, M.E. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab. Apr 1989. 102p. (WES/TR/EL–89-6). Available from NTIS, PC A06/MF A01.

Since the 1950s the Craney Island disposal facility has been used for containment of dredged material from the navigable channels and harbors of Hampton Roads, VA. The site has annually received between 3 and 4-million cu m of maintenance dredged material. Since the existing site is nearing maximum capacity, studies were begun to evaluate potential expansion alternatives in an effort to identify the alternative that will maximize existing storage capacity (and provide approximately 50 years of additional storage capacity) while minimizing environmental impacts. The focus of this study was the volumetric storage capacity of each alternative, while two other concurrent studies evaluated separately; (a) the hydrodynamic impacts of each expansion alternative on the flow regime in the Hampton Roads area; and (b) the geotechnical feasibility of constructing retaining dikes for each alternative. The storage capacity, and thus the remaining active disposal life, of the existing Craney Island facility was determined as well as that of each expansion alternative, both with and without considering the existing facility. The scenarios were evaluated assuming an active dewatering program. The influence of subdividing the expansion facility into multiple compartments was also evaluated. Input requirements to the computer program (Primary Consolidation and Desiccation of Dredged Fill), necessitated compilation of the consolidation characteristics of the foundation soil and dredged material as well as the appropriate values to simulate site dewatering.

46165 (ANL/EES-TM–377) **Determination of ecologically vital groundwaters at selected sites in the Formerly Utilized Sites Remedial Action Program.** Vinikour, W.S.; Yin, S.C.L. Argonne National Lab., IL (USA). Aug 1989. 48p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract W-31109-ENG-38. Order Number DE89015642/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The US Department of Energy is classifying groundwaters at sites in its Formerly Utilized Sites Remedial Action Program (FUSRAP). Of particular concern is the potential presence of groundwaters that are highly vulnerable to contamination and that are either (1) irreplaceable sources of drinking water or (2) ecologically vital. Conditions at nine FUSRAP sites were evaluated to determine if ecologically vital groundwaters are present. The sites evaluated were Wayne Interim Storage Site, Maywood Interim Storage Site, and Middlesex Sampling Plant in New Jersey; Ashland 2 Site, Seaway Industrial Park, Colonie Interim storage Site, and Niagara Falls Storage Site in New York; and the St. Louis Airport Site and Hazelwood Interim Storage Site in Missouri. The analyses indicated that groundwaters are vulnerable to contamination at all but two of the sites – the Ashland 2 and Seaway Industrial Park sites in New York. Groundwater discharge points were identified within a 2-mile radius (i.e., the classification review area) of all of the sites. No ecologically vital groundwater areas exist in the vicinities of any of the nine FUSRAP sites evaluated. 35 refs., 17 figs.

46166 (CONF-881054–Vol.1, pp. 93-104) **Development of a driven multilevel groundwater sampling well and instrumentation for measuring vertical hydraulic gradient over short distances.** Young, S.C. (Tennessee Valley Authority Engineering Lab., Norris (USA)); Boggs, J.M. Analysas Corp., Oak Ridge, TN (USA). 1988. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 1.* Order Number DE89014700/JAW. Available from NTIS, PC A15/MF A01.

A natural gradient tracer experiment is currently underway at Columbus Air Force Base in Mississippi to investigate field-scale dispersion of groundwater solutes. The heterogeneity of the alluvial aquifer at the test site produces a complex hydraulic gradient field with vertical gradients that are two orders of magnitude larger than horizontal gradients at some locations. A driveable multilevel sampling well was developed for tracer sampling which minimizes the potential for artificial vertical groundwater movement in the disturbed annulus around the well in the presence of vertical hydraulic gradients. Methods were also developed for measuring the hydraulic heads in the sampling tubes of the multilevel samplers to examine the detailed hydraulic head field in the vicinity of the sampler. These methods include a vacuum manifold manometer, a tetrabromoethane manometer, and a differential pressure cell.

46167 (CONF-890975–2) **Volatilization, methylation, and demethylation of mercury in a mercury-contaminated stream.** Turner, R.R.; VandenBrook, A.J.; Barkay, T.; Elwood, J.W. From 7. international conference on heavy metals in the environment; 12-15 Sep 1989. Order Number DE89014099/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Environmental Science Divison publication No. 3326.

Radiolabeled mercury compounds introduced into water and sediment samples from a mercury-contaminated stream in Oak Ridge, Tennessee, USA, exhibited both abiotic and biotic transformations. Abiotic reduction of mercuric ion accounted for 10 to 70% of the volatilization of elemental mercury from water samples. Biotic reduction and volatilization increased in warmer months and proceeded rapidly without a lag period. Biotic methylation of mercuric ion was unexpectedly low (<0.2% of added mercuric was methylated in 2 days) and was consistently detectable only in water samples with added sediment (1% solids). Although the presence of sediment appeared to promote methylation of added mercuric ion, one experiment with radiolabeled sediment showed that sediment-bound mercury was essentially unavailable for methylation. Biotic demethylation of introduced methylmercury chloride in water samples was very efficient (>90% of the radiolabeled spike was demethylated and evolved as elemental mercury in <5 days). Although demethylation capacity was high in samples from the study stream, net production of methylmercury was unexpectedly low primarily because the substrate for methylation, mercuric ion, is rapidly lost from the solution phase by reduction and volatilization, and by adsorption to suspended sediment. 4 figs.

46168 (EC/Q/CP–8703) **Effects of acid precipitation on a boreal forest ecosystem. Ion budgets and changes in water chemistry for the Laflamme Lake watershed.** Papineau, M. Environment Canada, PQ (Canada). Conservation and Protection. 1987. 122p. (MICROLOG–87-06101). Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Data on surface waters have been gathered at the Laflamme Lake Watershed in Quebec as part of an ion budget research program. This watershed was set up in 1980 to assess the effects of long range transport of airborne pollutants on a boreal forest ecosystem receiving moderate to high sulphate loading. Precipitation data indicates that between 1981 and 1984, the average pH of water falling onto the watershed was 4.4, that precipitation quality is cyclic and that loading is episodic. The main components of precipitation on an equivalent basis are sulfate, hydrogen, nitrate and ammonium ions. ALthough the sulphate to nitrate ration is 2:1 on a yearly basis, nitrate ions are more important than sulphates in January. Since water and pollutants build up in the snowpack, spring melt is a critical period during which concentrations in surface waters and exports from the watershed are modifed for many parameters especially hydrogen and bicarbonate ions. Lake water quality is characteristic of lakes that are very sensitive to acidification. High sulfate values seem to indicate that the watershed has

been affected by atmospheric loading. The average pH of the lake (6.4) indicates that the lake is not yet greatly acidified. Important buffering occurs in the soil and surficial deposits of the watershed. Stream water is slightly less mineralized, slightly more acidic and shows more pronounced changes in water quality than lake water. Over the last five years, sulfate, conductivity and some heavy metal levels have increased in surface waters while no significant trends were seen for pH and alkalinity. In other Quebec monitoring lakes, trends of decreasing pH were seen during this period. When wet loading is compared to stream output, hydrogen and nitrate ions are seen to be retained in the watershed while Ca, Mg, Na, K, sulphate and chloride are lost. 63 refs. 31 figs. 32 tabs.

46169 (ETDE-mf–9914835) **Exploration ship METEOR - cruise no. 6. ATLANTIK 87/88 - legs no. 1-3 October-December 1987.** Berichte aus dem Institut fuer Meereskunde an der Christian-Albrechts-Universitaet Kiel. Mueller, T.J.; Siedler, G.; Zenk, W. Institut fuer Meereskunde an der Univ. Kiel (Germany, F.R.). 1988. 86p. (In German). Order Number DE89914835/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

The first three legs of METEOR cruise no. 6 were carried out between Hamburg, Las Palmas, Dakar and Abidjan. The core programme was part of the special research programme 'Warm Water Sphere of the Atlantic' at Kiel University. It included investigations of the North Atlantic subtropical gyre circulation and of mixing processes in the Cape Verde Frontal Zone. Tracer sampling was added to this programme. Furthermore, measurements were carried out to study heavy metals and petroleum hydrocarbons, and samples were collected for investigations of the oceanic particle flux, of the taxonomy and regional distribution of ichthyoplankton and of benthic communities. Air chemistry measurements were aimed at determining mixing ratios of various trace gases in the tropospheric boundary layer. The present report summarizes the goals of the investigations, the work at sea and first results. (orig.).

46170 (FO–1987) **Acidification of surface waters in eastern Canada and its relationship to aquatic biota.** Kelso, J.R.M.; Minns, C.K.; Gray, J.E.; Jones, M.L. Department of Fisheries and Oceans, Ottawa, ON (Canada). 1987. 47p. (In French). (MICROLOG–87-04650). Available from Canada Dept. of Fisheries and Oceans, Scientific Publications, 200 Kent St., 14th Floor, Ottawa, ON, CAN K1A 0E6; $6.00; OTHER COUNTRIES: $7.20 CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Data collected in lakes and rivers of eastern Canada subjected to atmospheric deposition, essentially >20 kg SO_4^2 hectarely, indicated that the trend of fewer species of fish, phytoplankton, zooplankton, and benthos below pH 6 persists. Not only are there fewer species below pH 6, but also the abundance of at least fish (as reflected by catch per unit effort) declines with decreasing pH. It is also evident that physical limits of the aquatic habitat exerts a strong influence upon diversity at all community levels. This intrinsic effect from the habitat is then further influenced by pH and alkalinity. Fish body burdens of trace metals (Hg, Al, Mn, Fe) appear weakly related to lake pH/alkalinity conditions. All provinces had fish from remote lakes with body burdens of Hg in excess of human health guidelines. In all provinces except New Brunswick, 27–47% of lakes had fish exceeding these public health guidelines. All indicators of lake sensitivity suggest that freshwaters, and consequently, the fishery resource, of Nova Scotia are by far the most senstive (>1 200 km^2 of lake surface area already acidic; alkalinity pH 5.3 and less). Overall, it is estimated that there are 700,000 lakes in eastern Canada receiving deposition considerably above background; that 4,243 km^2 (> 14,000 lakes) are currently acidic; and that more than 150,000 lakes have a pH<6.0, a level identified as a threshold of effect. 80 refs 11 figs 35 tabs

46171 (HW–11642) **Fish and fish problems of the Hanford Reservation.** Olson, P.A. Hanford Works, Richland, WA (USA). 23 Nov 1948. 7p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC06-76RL01830. Order Number DE89016478/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

The Columbia River, which is the largest river on this coast having a length of approximately 1200 miles and draining some 259,000 square miles, has long been one of the most productive fish streams in the world. In addition to the salmon industry which has an annual wholesale value of somewhere around ten million dollars, considerable sport-fishing for salmon, trout, sturgeon, bass and whitefish exists. The utilization of Columbia River for power, navigation, industry, irrigation and municipal needs is becoming ever greater. In competition with man and man's influences the commercially valuable fish runs are steadily declining in number. In utilizing vast quantities of water the Hanford Works joins this man made list of competitors with the fish populations. A brief history of the development of the Columbia River basin is of interest.

46172 (ORNL/TM–11252) **Final report of the Oak Ridge Task Force concerning public health impacts of the off-site contamination in East Fork Poplar Creek and other area streams.** Travis, C.C.; Blaylock, B.G.; Daniels, K.L.; Gist, C.S.; Hoffman, F.O.; McElhaney, R.J.; Weber, C.W. Oak Ridge National Lab., TN (USA). Aug 1989. 32p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89016938/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

As a result of operations associated with the Department of Energy (DOE) facilities near Oak Ridge, Tennessee, a nearby creek, East Fork Poplar Creek (EFPC), became contaminated with mercury and trace levels of other metals, organics and radionuclides. An interagency task force, identified as the Oak Ridge Task Force (ORTF) was organized to investigate the extent of off-site environmental contamination of EFPC and other area streams related to the Oak Ridge Reservation, and to determine if any immediate public health impacts might result from such contamination. Four study groups were established by the ORTF to supervise investigations of fisheries, groundwater, soils, surface water, sediment, and floodplains. A fifth study group was established to perform an evaluation of possible public health impacts. The DOE also authorized several organizations to collect and analyze samples and make field measurements needed by the Task Force. The Tennessee Valley Authority (TVA) was authorized to perform an instream contaminant study to determine the extent of contamination of surface water, sediment, fish, and floodplains. The US Geological Survey (USGS) was authorized to determine the extent of groundwater contaminant. Oak Ridge Associated Universities (ORAU) was charged with determining the extent of contamination of the terrestrial foodchain which might be consumed by humans. Oak Ridge National Laboratory (ORNL) was requested to provide assistance in health impact assessments. 19 refs., 12 tabs.

46173 (PB–89-190573/XAB) **USEPA (United States Environmental Protection Agency) method study 35. SW method 3005. Acid digestion of waters for total recoverable or dissolved metals for analyses by flame atomic absorption spectroscopy. Report for September 1986-December 1987 (Final).** Edgell, K.W. Bionetics Corp., Cincinnati, OH (USA). Apr 1989. 281p. Available from NTIS, PC A13/MF A01.

An interlaboratory collaborative study was conducted to determine the precision and bias (recovery) of Solid Waste (SW) Method 3005 for the analysis of 21 elements in ground water. The study design was based upon Youden's non-replicate plan for collaborative tests of analytical methods. Each water type was spiked with six concentrations (as three Youden pairs) of the 21 test elements and was prepared using nitric/hydrochloric acid digestion and analyzed by Atomic Absorption (AA-Direct Aspiration). Test data from three spiked ground water sources were compared against reagent water which was used as a control. The study produced, for each element, measures of precision and mean recovery for the acid digestion/AA-Direct Aspiration and compared the performance of the method between water types and reagent water.

46174 (PB–89-192587/XAB) **Pesticides in ground-water data base: 1988 interim report.** Environmental Protection Agency, Washington, DC (USA). Office of Pesticide Programs. Dec 1988. 39p. Available from NTIS, PC A03/MF A01.

One of EPA's priorities is to determine the extent of pesticides occurring in the nation's ground water. While many individual, localized ground-water monitoring studies have been conducted across the country, there has been no comprehensive compilation of these results. In response to this, the EPA's Office of Pesticide Programs has developed the Pesticides in Ground Water Data Base. The data base contains information derived from monitoring studies conducted by pesticide registrants, universities, and government

agencies. The data base identifies the pesticides that have been looked for in ground water, the areas that have been monitored, and the pesticides that have been detected. The data base was developed in the first quarter of 1988, and at the same time, a public docket was established so interested parties could have access to the source information. Following the development of the data base, the EPA has been conducting a program to assess the validity of the information it contains. At this time, the authors believe they have gathered sufficient information to provide the public with an interim report on the national status of pesticide residues in ground water.

46175 (PB–89-197115/XAB) **Regional ground-water quality characterization of the Rockford area, Winnebago County, Illinois: An assessment of volatile organic compounds and selected trace metals.** Wehrmann, H.A.; Holm, T.R.; Stecyk, A.N.; Le Seur, L.P.; Curtiss, C.D. Illinois State Water Survey Div., Champaign, IL (USA). Ground-Water Section. Sep 1988. 124p. Available from NTIS, PC A06/MF A01.

This report summarizes an investigation of regional ground-water quality in the Rockford area in north-central Illinois. The investigation was launched to determine if regional ground-water contamination, principally by volatile organic compounds (VOCS), has occurred in the Rockford area. A number of investigations conducted by local and state agencies have documented the presence of VOCs in the ground water at several locations in or near the city of Rockford, Illinois. An estimated 300 wells, including 16 public water supply wells, were affected by the presence of organic compounds in over 20 instances of ground-water contamination in Winnebago County documented since 1970. Despite the fact that several wells were found to contain VOCs, the preponderance of information collected during the study shows that regional contamination of ground water in the Rockford area has not occurred.

46176 (PB–89-197495/XAB) **Anaerobic biodegradation of 2,4-dichlorophenol in freshwater lake sediments at different temperatures.** Kohring, G.W.; Rogers, J.E.; Wiegel, J. Georgia Univ., Athens, GA (USA). 1989. 8p. Available from NTIS, PC A02/MF A01.

Pub. in Applied and Environmental Microbiology 55, No. 2, 348-353(Feb 1989).

Anaerobic degradation of 2,4-dichlorophenol (2,4-DCP) between 5 and 72C was investigated. Anaerobic sediment slurries prepared from local freshwater sediments were partitioned into anaerobic tubes or serum vials, which then were incubated separately at the various temperatures. Reductive 2,4-DCP dechlorination occurred only in the temperature range between 5 and 50C, although methane was formed up to 60C. In sediment samples from two sites and at all temperatures from 5 to 50C, 2,4-DCP was transformed to 4-chlorophenol (4-CP). The 4-CP intermediate was subsequently degraded after an extended lag period in the temperature range from 15 to 40C. Adaptation periods for 2,4-DCP transformation decreased between 5 and 25C, were essentially constant between 25 and 35C, and increased in the tubes incubated at temperatures between 35 and 40C. This suggests that at least two different organisms were involved in the transformation of 2,4-DCP to 4-CP.

46177 (PB–89-200398/XAB) **Sediment-quality-values refinement. Volume 1. 1988 update and evaluation of Puget Sound AET (Apparent Effects Threshold). Final report.** Barrick, R.; Becker, S.; Brown, L.; Beller, H.; Pastorok, R. PTI Environmental Services, Bellevue, WA (USA). Sep 1988. 177p. Available from NTIS, PC A09/MF A01.

See also PB–89-200406.

This report contains a detailed evaluation of the Apparent Effects Threshold (AET) approach. The AET approach can be used to develop chemical-specific sediment-quality values. As part of the effort, AET values were generated for Puget Sound, Washington, and applied in a predictive manner to approximately 300 stations. The objective of the investigation was to test the reliability of AET, and potential sediment quality standards based on AET, in predicting adverse biological effects associated with sediment contamination. Of the 201 benthic infauna stations and 287 amphipod bioassay stations evaluated, approximately 75% were in accordance with AET predictions. Approximately 96% of the 50 stations at which oyster larvae and microtox bioassays performed were in accordance with AET predictios. Based on AET for the four biological indicators, Puget Sound maps were produced showing the location of predicted impacts in the estuary. The effort involved the generation and evaluation of AET for 58 metal and organic chemicals.

46178 (PB–89-200406/XAB) **Sediment-quality-values refinement. Volume 1. Data appendices. 1988 update and evaluation of Puget Sound AET (Apparent Effects Threshold). Final report.** Barrick, R.; Becker, S.; Brown, L.; Beller, H.; Pastorok, R. PTI Environmental Services, Bellevue, WA (USA). Sep 1988. 296p. Available from NTIS, PC A13/MF A01.

46179 (PB–89-866362/XAB) **Bioindicators of marine pollution. January 1974-July 1989 (Citations from Oceanic abstracts). Report for January 1974-July 1989.** National Technical Information Service, Springfield, VA (USA). Jul 1989. 144p. Available from NTISPC N01/MF N01.

Supersedes PB–86-873916.

This bibliography contains citations concerning the utilization of marine plants and animals as indicators of organic and inorganic pollutant distribution. Topics include descriptions of specific species and assemblages, regional and local monitoring studies, and analyses of the soft and hard parts of marine animals. Studies of algae, bivalves, corals, crustaceans, bacterial counts, and seagrasses in estuaries and benthic areas are included. (This updated bibliography contains 296 citations, 40 of which are new entries to the previous edition.)

46180 **Process for removing metals from water.** Napier, J.M.; Hancher, C.M.; Hackett, G.D. To Dept. of Energy, Washington, DC. USA Patent 4,814,091. 21 Mar 1989. Filed date 29 Jun 1987. vp. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

A process for removing metals from water including the steps of prefiltering solids from the water, adjusting the pH to between about 2 and 3, reducing the amount of dissolved oxygen in the water, increasing the pH to between about 6 and 8, adding water-soluble sulfide to precipitate insoluble sulfide and hydroxide-forming metals, adding a flocculating agent, separating precipitate-containing floc, and postfiltering the resultant solution. The postfiltered solution may optionally be eluted through an ion exchange resin to remove residual metal ions.

46181 (AECL–9345) **Hydrogeologic studies for CRNL's proposed shallow land burial site.** Killey, R.W.D.; Devgun, J.S. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Sep 1986. 14p. (CONF-8609350–: 2. international conference on nuclear waste management, Sep 1986). Order Number DE89635117/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The first phase of conversion from storage to disposal of low- and intermediate-level radioactive wastes at CRNL is focussed on solids with hazardous lifetimes less than 500 years. In order to use a facility buried above the water table and to achieve maximum use of radionuclide migration information from studies of existing facilities, the proposed site is located in sands above an active groundwater flow system. The selection of a permeable and geologically-simple slow system has allowed application of a wide variety of techniques for hydrogeologic evaluation of the site. Ground-probing radar in

conjunction with continuously cored boreholes have provided stratigraphic data and sediments for testing. Field hydrogeologic testing has included a detailed network of piezometers for hydraulic head mapping and a series of borehole dilution tests. Measurements of contaminant sorption behaviour are also being made in the field to reduce variations in uncontrolled parameters. Mathematical models successfully simulate the real system in terms of groundwater flow. Simulations of reactive contaminant transport are more difficult, but the application of data from field tests of radionuclide migration behaviour and from existing contaminant plumes will, we believe, provide acceptably reliable predictions of the impact of failures in the engineered disposal structure.

46182 (CONF-890975–1) **Radionuclide tracers for the fate of metals in the Savannah estuary: River-ocean exchange processes.** Olsen, C.R.; Thein, M.; Larsen, I.L.; Byrd, J.T.; Windom, H.L. Oak Ridge National Lab., TN (USA). 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 7. international conference on heavy metals in the environment; 12-15 Sep 1989. Order Number DE89013056/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Plutonium-238 from the US Department of Energy's Savannah River Plant labels riverborne particles, providing a unique opportunity for examining the fate of metals in estuaries and for tracing river-ocean exchange processes. Results indicate that plutonium and lead-210 are enriched on estuarine particles and that inputs of plutonium from oceanic sources greatly exceed inputs from riverborne or drainage-basin sources as far upstream as the landward limit of seawater penetration. We suggest that these radionuclides (and other chemically reactive metals) are being scavenged from oceanic water by sorption onto particles in turbid estuarine and coastal areas. Since estuaries, bays, mangroves, and intertidal areas serve as effective traps for fine particles and associated trace substances, these results have important implications concerning the disposal of chemically reactive substances in oceanic waters. 13 refs., 1 fig., 1 tab.

46183 (HW–56242) **Interim report on the origin of reactor effluent water radioisotopes: Analysis of Turco purge material.** Perkins, R.W. General Electric Co., Richland, WA (USA). Hanford Atomic Products Operation. 3 Jun 1958. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE89016479/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

Declassified 17 Aug 1989.

A research program is underway in the Analytical Chemistry group for the purpose of determining the origin of the more important reactor effluent water radioisotopes. As part of this program the radioisotopic composition of the film material which is formed on the surface of process tubes and fuel elements was to be determined. A recent production test (IP-161-AE, HW-55849) performed by IPD Radiological Engineers, using the chemical cleaner Turco 4306B, has provided samples of this film material for radioisotopic analysis. Because of the relatively large amounts of radioisotopes removed by a Turco purge, compared with diatomaceous earth purges and the possibility of a future full-pile decontamination with Turco and its subsequent disposal to the river, the results of this study are being published so that proper hazard evaluations can be made.

46184 (JINR-N–5(31)-88, pp. 13-20) **Search for the spontaneously fissioning nuclide in Cheleken hot brines.** Dmitriev, S.N.; Flerov, G.N.; Azarov, V.A.; Shishkin, S.V.; Lebedev, V.Ya.; Krasnov, A.V.; Shishkina, T.V.; Pokrovskij, V.K.; Sokol, E.A. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012200/JAW. Available from NTIS (US Sales Only), PC A03/MF A01; INIS.

By using the method of chemical enrichment (coprecipitation, cementation, sorption, extraction etc.) the isolation of trace elements from the hot brines of the Cheleken peninsula was carried out. Some 10-15 m^3 of brine were processed in a single experiment. The concentration factor for the trace elements reached the value 10^3-10^5. The samples obtained were studied using a ^{3}He-counter neutron- multiplicity detector. No spontaneously fissioning nuclide (SFN) was revealed in the samples at a detection limit of 10^{-13} g/g. The possible explanations of that are discussed. On the basis of the special study of the chemical forms of the trace elements, the possible analogs of superheavy elements in hot brines, and from the analysis of the results of the present and previous searches for the SFN in Cheleken hot brines an assumption has been advanced that the SFN is present in the brines as compounds with organic admixtures, like gold and mercury are. Prospects of further work aimed at detecting the SFN in Cheleken hot brines are discussed. 19 refs.; 2 tabs.

46185 (PB–89-126148/XAB) **Environmental radionuclide concentrations in the vicinity of the calvert cliffs nuclear power plant: 1985-1986. Final report.** Domotor, S.L.; McLean, R.I. Maryland Power Plant Research Program, Annapolis, MD (USA). Nov 1988. 53p. (PPRP/PPER-R–10). Available from NTIS, PC A04/MF A01.

See also PB–88-150297.

High-resolution gamma spectroscopy was used to determine radionuclide concentrations in sediment, finfish, shellfish, and aquatic vegetation collected from the Chesapeake Bay in the vicinity of the Calvert Cliffs Nuclear Power Plant (CCNPP) during 1985-1986. Low concentrations of radionuclides attributable to CCNPP (Ag-110m, Co-58, Co-60, and Zn-65) were detected in all biota (except edible finfish) and in sediments. Silver-110m was the principal CCNPP-related radionuclide detected in biota (particularly oysters); Co-58 and Co-60 were the principal CCNPP-related radionuclides detected in sediments. CCNPP-related radionuclide concentrations detected in Bay biota and sediments were within ranges observed in previous years and represent small increments to radionuclide concentrations in the Bay relative to natural and weapons test levels.

46186 (PB–89-193361/XAB) **Stable-isotope investigation of vapor transport during ground-water recharge in New Mexico. Technical completion report.** Knowlton, R.G.; Phillips, F.M.; Campbell, A.R. New Mexico State Univ., Las Cruces, NM (USA). New Mexico Water Resources Research Inst. Feb 1989. 99p. (WRRI–237). Available from NTIS, PC A05/MF A01.

New Mexico (especially the southern part of the state) is heavily dependent on ground water for agricultural irrigation, municipal supply, and economic development. The quantification of recharge is thus very important. A technique was presented to model the transport of the stable-isotopes (2)H and (18)O. The model developed here can predict the shape of the stable isotope profiles in the vadose zone, and also quantify the vapor-flux portion of soil-water movement. Through a nonlinear least-squares approach, the model is matched to an observed isotope profile by optimizing the values of specified variables. The optimized parameters are then used to numerically solve for the vapor flux as a percentage of the deep flux of water below the root zone. The technique of modeling the isotope species transport is much more robust than conventional heat and moisture flow-modeling techniques. The conclusion stems from the fact that the effective isotopic diffusivities vary little with water content, whereas hydraulic diffusivity is strongly dependent on water content. Based upon the model results, in the top 2.7 meters of the soil profile a depth-averaged estimate of 15 to 33% of the total soil-water movement is in the vapor phase. This implies that the liquid flux of water is most important in the recharge process.

46187 (PB–89-194385/XAB) **Economic benefit considerations in selecting water-quality projects: Insights from the Rural Clean Water Program. Staff report.** Piper, S.; Magleby, R.S.; Young, C.E. Economic Research Service, Washington, DC (USA). Resources and Technology Div. May 1989. 34p. (AGES–89-18). Available from NTIS, PC A03/MF A01.

The Rural Clean Water Program was initiated in 1980 to demonstrate the effectiveness of improved agricultural land management practices in enhancing water quality. Projects that preserve or improve water quality in a heavily used lake or estuary appear to have the greatest potential for generating net benefits. This appears particularly true for projects with recreational or commercial fishing impairments. About a third of the projects have good prospects for generating net benefits under current circumstances.

Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 May 1988. 63p. (EPA/ROD/R–02-88/060). Available from NTIS, PC A04/MF A01.

The Montgomery Township Housing Development (MTHD) site is located in Somerset County, New Jersey. The Rocky Hill Municipal Wellfield (RHMW) Superfund site is also covered by the remedial action because of its proximity to the MTHD and the similarity of the contaminants present. The 72-acre MTHD site is a development which includes 71 private homes, with an additional 6 homes affected by the contamination in the surrounding residential areas. The RHMW consists of a two-acre tract of land in the Borough of Rocky Hill, which supplies public water to the residents of Rocky Hill. The selected remedial action for this site includes: ground water pump and treatment using air stripping and reinjection of the treated water back into the aquifer.

As part of a series of studies investigating the impact of climate warming expected from the greenhouse effect due to a doubling in atmospheric carbon dioxide a specific climate change scenario, and hydrologic and economic models, examined the impacts on Great Lakes navigation and power generation. The mean temperature increase in such a scenario is expected to be about 4.5 degrees C. Mean lake levels may be reduced 30-80 cm and mean flows in the connecting channels may be reduced by up to 20%. If climatic change and increased consumptive use of Great Lakes water occur, low levels would occur in 8 years out of 10. Maximum ice cover may decline to 0% for all lakes except Erie (whose cover would decline to 50%), permitting an 11 month ice-free shipping season. Average annual costs to shipping companies for the 4 principal cargoes (iron ore, grain, coal, and limestone) may increase about 30%. Shipping costs may equal or exceed those of the period of low lake levels of 1963-65 in 9 years out of 10. For the Canadian hydroelectric generating stations on the lakes, climatic change plus increased consumptive use could result in a loss of 4165 GWh of power generation. Replacing the lost production with a mix of nuclear and fossil fuel generation could cost $111 million in 1984 Canadian dollars. Warmer temperatures will result in a lower demand for energy in winter and a slight decrease in summer, resulting in an average annual saving of $172-204 million (1984 Canadian dollars). 7 figs., 3 tabs.

46190 X-ray Fourier-transform holographic microscope. Haddad, W.S. (MCR Technology Corporation, Chicago, IL (USA)); Cullen, D.; Solem, J.C.; Boyer, K.; Rhodes, C.K. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). DOE Contract FG02-86ER13610. From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The properties of an x-ray Fourier-transform holographic instrument suitable for imaging hydrated biological samples are described. Recent advances in coherent x-ray source technology are making diffraction-limited holograms of microscopic structures, with corresponding high spatial resolution, a reality. A high priority application of snapshot x-ray holography is the study of microscopic biological structures in the hydrated living state. X-rays offer both high resolution and high contrast for important structures within living organisms, thereby rendering unnecessary the staining of specimens, essential for optical and electron microscopy. If the wavelength is properly chosen. Furthermore, the snapshot feature, arising from picosecond or subpicosecond exposure times, eliminates blurring occurring from either thermal heating or normal biological activity of the sample. Finally, with sufficiently high photon fluxes, such as those available from x-ray lasers, the x-ray snapshot can be accomplished with a single pulse, thereby yielding complete three-dimensional information on a sample having normal biological integrity at the moment of exposure. 10 refs., 6 figs.

46191 First images from the Stanford tabletop scanning soft x-ray microscope. Trail, J.A. (Stanford Univ., CA (USA)); Byer, R.L. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). DOE Contract AC03-76SF00098. From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The authors have constructed a scanning soft x-ray microscope which uses a laser-produced plasma as the soft x-ray source and normal incidence multilayer coated mirrors in a Schwarzschild configuration as the focusing optics. The microscope operates at a wavelength of 140 Å, has a spatial resolution of 0.5 μm, and has a soft x-ray photon flux through the focus of $10^4 s^{-1}$ when operated with only 170 mW of average laser power. The microscope is compact; the complete system, including the laser, fits on a single optical table. In this paper they describe the microscope and present images of metallic microstructures.

46192 X-ray holographic microscopy: Improved images of zymogen granules. Jacobsen, C. (Lawrence Berkeley Lab., CA (USA)); Howells, M.; Kirz, J.; McQuaid, K.; Rothman, S. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). DOE Contract AC02-76CH00016. From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Soft x-ray holography has long been considered as a technique for x-ray microscopy. It has been only recently, however, that submicron resolution has been obtained in x-ray holography. This paper will concentrate on recent progress that has been made in obtaining reconstructed images of improved quality. 15 refs., 6 figs.

46193 Amplitude- and phase-contrast x-ray microscopy. Schmahl, G. (Univ. of Goettingen (Germany, F.R.)). pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

X-ray photons in the wavelength range of about 0.5 - 5 nm are best suited for x-ray microscopy. In the wavelength range $\lambda \gtrsim 2.5$ nm the absorption cross sections are about one order of magnitude smaller than the cross sections for electrons in the energy range in which electron microscopy is performed. These absorption cross sections for soft x-rays are appropriate for high resolution investigation of biological specimens in their natural state having a thickness of up to about 10 micrometer. Especially interesting is the wavelength range between the K absorption edges of oxygen (λ = 2.34 nm) and carbon (λ = 4.38 nm) because in this wavelength range

the radiation is weakly absorbed by water but strongly absorbed by organic matter resulting in a rather good amplitude contrast of wet specimens. For many elements and wavelengths phase shift is the dominating process and not photoelectric absorption. That means that phase-contrast x-ray microscopy can be performed with the following advantages compared to x-ray microscopy modes using amplitude contrast: For wavelengths larger than the carbon K-edge, the amplitude contrast of organic material surrounded by water is very low. To the contrary, for wavelengths slightly larger than CKα the phase contrast of such an object is high. Even in the wavelength range between the K-edges of carbon and oxygen (water window) wavelengths are found for which imaging in phase contrast is better concerning contrast and dosage compared to amplitude contrast imaging. In addition, imaging with phase contrast can be extended to wavelengths of about 0.5 nm with a dosage comparable to that necessary for imaging with amplitude contrast in the water window. The last point may be of practical importance in future work because with shorter wavelengths thicker specimens can be investigated than up to now. 3 refs.

46194 X-ray holography: X-ray interactions and their effects. London, R.A. (Univ. of California, Livermore (USA)); Trebes, J.E.; Rosen, M.D. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). DOE Contract W-7405-ENG-48. From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The authors summarize a theoretical study of the interactions of x-rays with a biological sample during the creation of a hologram. The choice of an optimal wavelength for x-ray holography is discussed, based on a description of scattering by objects within an aqueous environment. The problem of the motion resulting from the absorption of x-rays during a short exposure is described. The possibility of using very short exposures in order to capture the image before motion can compromise the resolution is explored. The impact of these calculation on the question of the feasibility of using an x-ray laser for holography of biological structures is discussed. 12 refs., 2 figs.

46195 Soft x-ray lenses with 400 Å outer zone width. Vladimirsky, Y. (Univ. of California, Berkeley (USA)); Kern, D.; Chang, T.H.P.; Meyer-Ilse, W.; Guttmann, P.; Greinke, B.; Attwood, D. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Fresnel zone plate lenses for focussing and imaging radiation in the 10-50 Å wavelength region have been fabricated with outer zone widths as small as 400 Å. The zone plates were fabricated by electron beam lithography using a high resolution vector scan system designed specifically for nanometer pattern writing. A special circular pattern generation technique, utilizing high speed polar/cartesian conversion was utilized. Field size was calibrated for squareness and orthogonality using electron beam lithography calibration marks and laser interferometry. Patterns were written in a 180-200 nm thick PMMA resist on a 30 nm gold electroplating base. The substrate was a 100 nm silicon nitride film. The pattern received a dose of 250 $\mu C/cm^2$ at 25 KeV. Special patterns requiring a thick central stop region, received a doubled dose, followed by a double development/double plating technique. A method utilizing the phenomenon of form birefringence was used for monitoring the development of the fine features. In the optical microscope with polarized light and crossed analyzer, a distinct change of the reflected intensity is observed during the final stages of development. Text patterns imaged at 45 Å wavelength demonstrate a spatial resolution approaching 500 Å. Measurements of zone plate efficiency are also described.

46196 (LA-UR–89-2456) **Computer symbiosis: Emergence of symbiotic behavior through evolution.** Ikegami, Takashi; Kaneko, Kunihiko. Los Alamos National Lab., NM (USA). [1989]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8905201–1: Conference on emergent computation, 22-26 May 1989). Order Number DE89015247/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

Symbiosis is altruistic cooperation between distinct species. It is one of the most effective evolutionary processes, but its dynamics are not well understood as yet. A simple model of symbiosis is introduced, where we consider interactions between hosts and parasites and also mutations of hosts and parasites. It is found that a symbiotic state emerges for a suitable range of mutation rates. The symbiotic state is not static, but dynamically oscillates. Harmful parasites violating symbiosis appear periodically, but are rapidly extinguished by hosts and other parasites, and the symbiotic state is recovered. The emergence of "Tit for Tat" strategy to maintain symbiosis is discussed. 4 figs.

46197 (LA-UR–89-2618) **Core evolution: Emergence of cooperative structures in a computational chemistry.** Rasmussen, S.; Feldberg, R.; Hindsholm, M.; Knudsen, C. Los Alamos National Lab., NM (USA). 1989. 44p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8905201–2: Conference on emergent computation, 22-26 May 1989). Order Number DE89016605/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have developed an artificial ecology in the computer core, where one is able to evolve assembler-automaton code without any predefined evolutionary path. The system, in the present version has one dimension, is updated in parallel, the instructions are only able to communicate locally, and the system is continuously subjected to noise. The system also has a notion of computational resources. Depending on the specified parameters and the level of complexity of distance from a randomized core, this electronic garden is started at, we see different evolutionary paths. For several initial conditions the system is able to develop extremely viable cooperative programs (organisms ?) which totally dominates the core. This demonstrates the emergence of complex functional properties in a computational environment. 21 refs., 7 figs., 2 tabs.

46198 (ORNL–6545) **Biomedical and Environmental Sciences Program publications 1988.** Johnson, C.A.; Deaton, D.H.; Ellis, J.R.; Norman, V.S.; Rader, K.J.; Rhew, D.H. Oak Ridge National Lab., TN (USA). Jun 1989. 82p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89015644/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This bibliography contains more than 600 references to journal articles, books, book chapters and proceedings, reports, abstracts, newsletters, and miscellaneous documents published during 1988 under Oak Ridge National Laboratory Biomedical and Environmental Sciences programs. The list includes publications authored by members of the Biology Division, Environmental Sciences Division, and Health and Safety Research Division in addition to those authored by members of divisions that receive funding through the Associate Laboratory Director for Biomedical and Environmental Sciences. A number of 1987 references that were not entered into the Laboratory Records data base in time for the previous publication are also included in this document. The bibliography is organized by publication type (i.e., journal articles, books, etc.), then by division, and within each division, alphabetically by the senior author. Indexes for journals and for authors are also provided. More than 270 journal articles were published in 1988. Most of these articles appeared in refereed journals, which is an excellent indication of the importance of subject matter and of thoroughness in presentation. Publications not appearing in this document include theses, dissertations, book reviews, most documents or reports prepared for internal distribution, letters to editors, and abstracts published in nonreferenced sources.

46199 Identification of DNA repair genes in the human genome. Hoeijmakers, J.H.J. (Erasmus Univ., Rotterdam (Netherlands)); van Duin, M.; Westerveld, A.; Yasui, A.; Bootsma, D. pp. 702 of Cold Spring Harbor symposia on quantitative biology. Volume 51, Molecular biology of Homo sapiens. Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (1986). From 51. Cold Spring Harbor symposium on quantitative biology: molecular biology of Homo sapiens; 28 May - 4 jun 1986.

To identify human DNA repair genes we have transfected human genomic DNA ligated to a dominant marker to excision repair deficient xeroderma pigmentosum (XP) and CHO cells. This resulted in the cloning of a human gene, ERCC-1, that complements the defect of a UV- and mitomycin-C sensitive CHO mutant 43-3B. The ERCC-1 gene has a size of 15 kb, consists of 10 exons and is located in the region 19q13.2-q13.3. Its primary transcript is processed into two mRNAs by alternative splicing of an internal coding exon. One of these transcripts encodes a polypeptide of 297 aminoacids. A putative DNA binding protein domain and nuclear location signal could be identified. Significant AA-homology is found between ERCC-1 and the yeast excision repair gene RAD10. 58 references, 6 figures, 1 table.

46200 (CONF-8907131–1) **Unusual hydrogen bonding patterns in AF [aminofluorene] and AAF [acetylaminofluorene] modified DNA.** Broyde, S.; Hingerty, B.E.; Shapiro, R.; Norman, D. Oak Ridge National Lab., TN (USA). [1989]. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 4. international conference on N-substituted aryl compounds: occurrence, metabolism and biological impact of nitroarenes; 15-19 Jul 1989. Order Number DE89015985/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

New structures are presented for AF and AAF modified DNAs that place the carcinogen in the minor groove of a B-DNA helix. These structures employ non-Watson-Crick base pairing schemes with syn guanine at the modification site. 32 refs., 9 figs.

46201 (CONF-8908117–1) **Function of active-site residues of ribulose-bisphosphate carboxylase/oxygenase (Rubisco).** Hartman, F.C.; Lee, E.H.; Smith, H.B. Oak Ridge National Lab., TN (USA). [1989]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 8. international congress on photosynthesis; 6-11 Aug 1989. Order Number DE89016264/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Chemical modification, site-directed mutagenesis, and x-ray crystallography have identified Lys166, Lys329, and Glu48 as active-site residues of the homodimeric Rubisco from Rhodospirillum rubrum. (In the L_8S_8 Rubisco from spinach, these residues correspond to Lys175, Lys334, and Glu60.) We have used two strategies to explore the function of these residues: (a) introduction of very subtle structural changes into their side chains by combining chemical modification with site-directed mutagenesis and (b) evaluation of the ability of mutant proteins, devoid in overall carboxylase activity, to catalyze the enolization of D-ribulose-1,5-bisphosphate (RuBP), i.e. the first step in the normal reaction pathway. 15 refs., 2 figs.

46202 (LBL–25981) **Neural networks and the human genome project.** Smith, S.D.G.; Hutchinson, M.S.; Flies, M.A. Lawrence Berkeley Lab., CA (USA). Feb 1989. 37p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE89016025/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Many of the computing problems involved in the human genome project fall into the category of problems that a neural network might be expected to solve, including: the prediction of splice junctions in DNA sequences, the prediction of secondary and tertiary structures of proteins, and the categorization of gels. This project was a summer undergraduate computer science project under the direction of the second author. The objective of this 10 week project was to explore how neural networks operate, what things affect this operation, and where they can plat a role in the human genome project. The neural network software was written or modified by the first author. The third author was responsible for the programs to access the Genbank DNA sequence databank. 9 refs., 14 figs.

46203 (LBL–27205) **In vivo and in vitro replication studies of a mutant SV40 virus isolated from transformed human cells.** Maulbecker, C.C. Lawrence Berkeley Lab., CA (USA). Apr 1989. 227p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE89016317/JAW. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

We report here that both GM637 and XP12ROSV harbor much higher numbers of extrachromosomal SV40 genomes than originally measured for GM637 (an average 100 copies of SV40 DNA/cell in GM637). Previous studies of GM637 have focused only on the state of the integrated viral DNA but not the extrachromosomal DNA. This chapter describes a thorough study of the GM637 and XP12ROSV extrachromosomal SV40 genomes, which we designate GMSV40 and XPSV40, respectively. The finding of extrachromosomal SV40 genomes in XP12RO complementation group A cells is especially intriguing as these cells are defective in DNA repair and have been used widely to study the effect of chemical DNA damaging agents and uv irradiation on DNA. Most but not all XP complementation groups have been shown to efficiently replicate viral DNA. The transformed daughter cell line XP12ROSV would thus be expected to be incapable of excising the integrated SV40 DNA, while being able to replicate exogenous SV40 genomes. This may suggest that the excision of integrated SV40 DNA does not occur and that XPSV40 comes from an extrachromosomal genome. 176 refs.

46204 (LBL-PUB–657/6-89) **Mapping the human genome.** Lawrence Berkeley Lab., CA (USA). Jun 1989. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE89016316/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The following pages aim to lay a foundation for understanding the excitement surrounding the "human genome project," as well as to convey a flavor of the ongoing efforts and plans at the Human Genome Center at the Lawrence Berkeley Laboratory. Our own work, of course, is only part of a broad international effort that will dramatically enhance our understanding of human molecular genetics before the end of this century. In this country, the bulk of the effort will be carried out under the auspices of the Department of Energy and the National Institutes of Health, but significant contributions have already been made both by nonprofit private foundations and by private corporation. The respective roles of the DOE and the NIH are being coordinated by an inter-agency committee, the aims of which are to emphasize the strengths of each agency, to facilitate cooperation, and to avoid unnecessary duplication of effort. The NIH, for example, will continue its crucial work in medical genetics and in mapping the genomes of nonhuman species. The DOE, on the other hand, has unique experience in managing large projects, and its national laboratories are repositories of expertise in physics, engineering, and computer science, as well as the life sciences. The tools and techniques the project will ultimately rely on are thus likely to be developed in multidisciplinary efforts at laboratories like LBL. Accordingly, we at LBL take great pride in this enterprise – an enterprise that will eventually transform our understanding of ourselves.

46205 Radioiodinated branched carbohydrates. Goodman, M.M.; Knapp, F.F. Jr. To Dept. of Energy, Washington, DC. USA Patent 4,826,966. 2 May 1989. Filed date 31 Mar 1988. 6p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

A radioiodinated branched carbohydrate for tissue imaging. Iodine-123 is stabilized in the compound by attaching it to a vinyl functional group that is on the carbohydrate. The compound exhibits good uptake and retention and is promising in the development of radiopharmaceuticals for brain, heart and tumor imaging.

46206 Electrophoretic extraction of proteins from two-dimensional electrophoresis gel spots. Zhang, J.S.; Giometti, C.S.; Tollaksen, S.L. To Dept. of Energy, Washington, DC. USA Patent 4,824,547. 25 Apr 1989. Filed date 4 Sep 1987. 13p. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

After two-dimensional electrophoresis of proteins or the like, resulting in a polyacrylamide gel slab having a pattern of protein gel spots thereon, an individual protein gel spot is cored out from the slab, to form a gel spot core which is placed in an extraction tube, with a dialysis membrane across the lower and of the tube. Replicate gel spots can be cored out from replicate gel slabs and placed in the extraction tube. Molten agarose gel is poured into the extraction tube where the agarose gel hardens to form an immobilizing gel, covering the gel spot cores. The upper end portion of the extraction tube is filled with a volume of buffer solution, and the upper end is closed by another dialysis membrane. Upper and lower bodies of a buffer solution are brought into contact with the upper and lower membranes and are provided with electrodes connected to the positive and negative terminals of a DC power supply, thereby

producing an electrical current which flows through the upper membrane, the volume of buffer solution, the agarose, the gel spot cores and the lower membrane. The current causes the proteins to be extracted electrophoretically from the gel spot cores, so that the extracted proteins accumulate and are contained in the space between the agarose gel and the upper membrane. A high percentage extraction of proteins is achieved. The extracted proteins can be removed and subjected to partial digestion by trypsin or the like, followed by two-dimensional electrophoresis, resulting in a gel slab having a pattern of peptide gel spots which can be cored out and subjected to electrophoretic extraction to extract individual peptides.

5503 Cytology

46207 Cytogenetic analysis by in situ hybridization with fluorescently labeled nucleic acid probes. Pinkel, D. (Lawrence Livermore National Laboratory, CA (USA)); Gray, J.W.; Trask, B.; van den Engh, G.; Fuscoe, J.; van Dekken, H. pp. 702 of Cold Spring Harbor symposia on quantitative biology. Volume 51, Molecular biology of Homo sapiens. Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (1986). DOE Contract W-7405-ENG-48. From 51. Cold Spring Harbor symposium on quantitative biology: molecular biology of Homo sapiens; 28 May - 4 jun 1986.

The use of probes that are modified chemically rather than radioactively has advantages for chromosome labeling. Hybridization is detected with reagents that bind with high affinity to the chemically modified probe and carry various types of reporter molecules. In addition discrimination of the hybridization of more than one probe to the same target becomes possible by using a different chemical modification and reporting molecule for each probe. We have focused on the use of fluorescent labeling because it is particularly suited for quantitative analysis through intensity measurement and high-resolution imaging. We call this procedure fluorescence hybridization. In this paper we demonstrate the application of fluorescence hybridization to the: rapid screening of interspecies hybrid cell lines for retained chromosomes and chromosomal rearrangements; use of human chromosome-specific probes to label selected chromosomes in interphase nuclei; study of the three-dimensional chromosomal organization in nuclei; and flow cytometric measurement of hybridization to human cell nuclei. 31 references, 3 figures.

46208 Application of synthetic DNA probes to the analysis of DNA sequence variants in man. Wallace, R.B. (Beckman Research Institute of the City of Hope, Duarte, CA (USA)); Petz, L.D.; Yam, P.Y. pp. 702 of Cold Spring Harbor symposia on quantitative biology. Volume 51, Molecular biology of Homo sapiens. Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (1986). From 51. Cold Spring Harbor symposium on quantitative biology: molecular biology of Homo sapiens; 28 May - 4 jun 1986.

Oligonucleotide probes provide a tool to discriminate between any two alleles on the basis of hybridization. Random sampling of the genome with different oligonucleotide probes should reveal polymorphism in a certain percentage of the cases. In the hope of identifying polymorphic regions more efficiently, we chose to take advantage of the proposed hypermutability of repeated DNA sequences and the specificity of oligonucleotide hybridization. Since, under appropriate conditions, oligonucleotide probes require complete base pairing for hybridization to occur, they will only hybridize to a subset of the members of a repeat family when all members of the family are not identical. The results presented here suggest that oligonucleotide hybridization can be used to extend the genomic sequences that can be tested for the presence of RFLPs. This expands the tools available to human genetics. In addition, the results suggest that repeated DNA sequences are indeed more polymorphic than single-copy sequences. 28 references, 2 figures.

46209 DNA-based detection of chromosome deletion and amplification: diagnostic and mechanistic significance. Latt, S.A. (Harvard Medical School, Boston, MA (USA)); Lalande, M.; Donlon, T.; Wyman, A.; Rose, E.; Shiloh, Y.; Korf, B.; Mueller, U.; Sakai, K.; Kanda, N. pp. 702 of Cold Spring Harbor symposia on quantitative biology. Volume 51, Molecular biology of Homo sapiens. Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (1986). From 51. Cold Spring Harbor symposium on quantitative biology: molecular biology of Homo sapiens; 28 May - 4 jun 1986.

This paper describes a few of the many possible examples in which application of a molecular cytogenetic approach can ultimately lead to a new, important understanding about the statics and dynamics of human chromosome structure. In the case of retinoblastoma, cytological observations of deletions and linkage analysis have positioned the retinoblastoma locus to bank 13q14. This locus is grossly deleted in some spontaneous tumors. It is still necessary to locate more precisely and characterize the nature of the retinoblastoma locus, as well as the basis for the heterogeneity in deletions removing one copy of this locus. One is left with the possibility that those deletions that may be observed cytologically reflect but the tip of the iceberg of deletions; detection of others may require molecular probes. A related question is the nature of the DNA sequences at the deletion boundaries and the role they play in promoting these deletions.

46210 Repetitive human DNA sequences. I. Evolution of the primate α-globin gene cluster and interspersed alu repeats. II. Properties of a transposon-like human element. Sawada, I. (Univ. of California, Davis (USA)); Schmid, C.W.; Deka, N.; Paulson, K.E.; Willard, C. pp. 702 of Cold Spring Harbor symposia on quantitative biology. Volume 51, Molecular biology of Homo sapiens. Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (1986). From 51. Cold Spring Harbor symposium on quantitative biology: molecular biology of Homo sapiens; 28 May - 4 jun 1986.

A repetitive family of human sequences is similar to transposons yeast Ty, Drosophilla copia, and mammalian proretrovirus. In human THE-family consists of 10,000 copies sharing a 2 Kb consensus sequence. Members of this family are flanked by short direct repeats, suggesting THE-1 elements insert into preferred target sites. THE-1 elements are present in extrachromosomal closed circular DNAs. Both transcriptional senses are represented in poly A plus RNAs as well as polysome bound RNAs. In one case, a THE-1 element processes the 3' end of a transcript resulting from an upstream promoter. A 4 Kb transcript, which is specific to Hela cells, results from insertion of a THE-1 element into this transcription unit. Monkey, chimpanzee and human share repetitive THE-1 families having a similar consensus sequence including orthologous member sequences. Parts of the THE-1 human sequence are present as single copy sequence elements in a lower primate, galago. Conceivable these single copy sequence elements result from ancestral sequences which rearranged prior to their successful amplification in the human genome. The structure of the galago alpha globin gene cluster more nearly resembles the structure of this region in such mammals as goat and horse rather than the structure in higher primates. The Alu family repeats in human and galago result from entirely independent insertion events. In contrast higher primates, human, chimpanzee and monkey, share orthologous Alu repeats. The divergence of these orthologous Alu repeats approximates the value expected for non selected DNA sequences. 34 references, 7 figures.

46211 Human genome and its evolutionary context. Bernardi, G. (Institut Jacques Monod, Paris (France)). pp. 702 of Cold Spring Harbor symposia on quantitative biology. Volume 51, Molecular biology of Homo sapiens. Cold Spring Harbor Laboratory, Cold Spring Harbor, NY (1986). From 51. Cold Spring Harbor symposium on quantitative biology: molecular biology of Homo sapiens; 28 May - 4 jun 1986.

The nuclear genome of man, like those of all warm-blooded vertebrates, exhibits a compositional compartmentalization, in that it mainly consists of a mosaic of very long (>>200 Kb) DNA segments, which belong to a small number of classes characterized by different GC levels. The families of DNA molecules derived from these classes can be separated and used to study the genome distribution of any sequence that can be probed. This approach has revealed the distribution of genes in the genomes of warm-blooded vertebrates. In the human genome the GC levels of both coding and non-coding sequences show a linear dependence on the GC levels of the isochores harboring the sequences. The latter observation prompted a study of the compositional constraints operating on

over 60 genomes from a very wide range of organisms. This work concerns that the effects of compositional constraints on codon usage as well as on the structure, stability and function of DNA, RNAs and proteins; the causes of compositional constraints and the processes underlying the fixation of mutations; the neutralist-selectionist controversy; and the nature of the organismal phenotype. 43 references, 4 figures, 2 tables.

46212 (INIS-mf-11479) **Application of nuclear technique for dynamic study in animal research.** Mohamad Aziz Dollah. Malaysian Agricultural Research and Development Inst., Serdang, Selangor (Malaysia). 1987. 3p. (CONF-8711314--: Seminar on the application of nuclear techniques in industry, 17 Nov 1987). Order Number DE89635255/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

This paper discusses the basic principle used for the study of the dynamic of biological compound in vivo using radioisotope with particular reference to water requirement study on farm animals. Some results of the study using the technique are also presented.

46213 Glycation of calmodulin: Chemistry and structural and functional consequences. Kowluru, R.A. (Los Alamos National Lab., NM (USA)); Heidorn, D.B.; Edmondson, S.P.; Bitensky, M.W.; Kowluru, A.; Downer, N.W.; Whaley, T.W.; Trewhella, J. *Biochemistry (USA)*, 28(5): 2220-2228 (7 Mar 1989).

In the presence of Ca2+ and glucose, calmodulin incorporates 2.5 mol of glucose/mol of protein. In the absence of Ca2+, only 1.5 mol of glucose is incorporated per mole of calmodulin. Glycation of calmodulin is associated with variable reductions in its capacity to activate three Ca2+/calmodulin-dependent brain target enzyme systems, including adenylyl cyclase, phosphodiesterase, and protein kinase. In addition, glycated calmodulin exhibits a 54% reduction in its Ca2+ binding capacity. Isolated CNBr cleavage fragments of glycated calmodulin suggest that glycation follows a nonspecific pattern in that each of seven available lysines is susceptible to modification. A limit observed on the extent of glycation appears related to the accompanying increase in negative charge on the protein. Glycation results in minimal structural rearrangements in calmodulin, and the Ca2+-induced increase in alpha-helix content and radius of gyration is the same for glycated and unmodified calmodulin. Since glycated calmodulin's Ca2+ binding capacity is reduced, this implies that the Ca2+-induced conformational changes in calmodulin do not require all four Ca2+ binding sites to be occupied. Examination of the lysine positions in calmodulin suggests that Ca2+ binding to domains II and IV is sufficient to induce these changes. The functional consequences of calmodulin glycation therefore cannot be attributed to inhibition of these conformational changes. An alternative explanation is that the inhibition arises from interference at the target enzyme binding site by bound glucose. While glycation shows minimal structural effects, a large pH dependence is observed for the alpha-helix content of unmodified calmodulin.

46214 Fractionation considerations for boron neutron capture therapy: The perspective of a clinician. Meek, A.G. (University Hospital at Stony Brook, NY (USA)). pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102--: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Fractionation is the cornerstone of modern megavoltage photon therapy. The sparsely ionizing nature of x-ray therapy seems to necessitate fractionation for successful sterilization of malignant tumors. However, high-LET, densely ionizing radiations such as neutrons or alpha particles are less dependent on fractionation for their success. In this context, the advantages and disadvantages of fractionation for boron neutron capture therapy for malignant gliomas are evaluated.

46215 Swine skin: A model to evaluate dose recovery from different radiations. Archambeau, J.O. (Loma Linda Univ., CA (USA)). pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102--: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

A swine skin model was selected to quantify the tissue dose response produced by the thermal neutron beam, adventitious radiations and boron-10 radiations used in the BNL clinical trials. This model was chosen because the irradiation geometry, anatomy with a subcutaneous fat layer, histology and known response to irradiation all approached that found in humans. The study quantified the parameters in the swine skin at gross, histologic, morphologic, cytologic, and kinetic levels and also simulated the radiation changes. The gross and histologic dose response to single-dose fractions of thermal neutrons, degraded fission neutrons and X rays, the dose response to multiple dose fractions of X rays and the $^{10}B(n,\alpha)^{7}Li$ reaction were compared. This paper lists the absorbed doses at which 50% of the irradiated fields were not healed (ED-50), the dose ratios, and the dose recovery values obtained in the post-clinical studies. The model will be used to obtain a preclinical appraisal of the dose distribution expected to be produced in humans using the optimized epithermal neutron beams on skin containing a range of boron-10 concentrations from compounds of clinical interest.

46216 Research on neutron capture therapy in the USSR. Ryabukhin, Y. (World Health Organization, Geneva (Switzerland)). pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102--: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Research on neutron capture therapy in the USSR began in 1964. Towards 1975 prime knowledge in physics, pharmacology and radiobiology had been accumulated. It was realized that inherent to NCT is a variety of modalities as to the type and location of the tumor, the energy and source of neutrons, the nature and transportation of the nuclide-carrying agent (NCA), etc. Thus, it became likely that some modalities would turn out to be clinically feasible. At the end of the 70s, studies of boron derivatives began at the All-Union Oncological Research Center, Moscow. These studies were stimulated by the clinical trials in Japan. Still, neutron capturing nuclides (NCN) other than ^{10}b are regarded as promising. Research was aimed at clinical trials that could ensure sufficient safety, convenience and conclusiveness. Hence, new requirements emerged, such as the pre-clinical modeling of NCT in big animals and the monitoring of tumor response to each fraction of NCT. Usual requirements are also to be met, that is: tailoring neutron beams with an adequate intensity and energy, choosing NCNs and finding suitable NCAs, physical and radiobiological planning including adoption of tentative RBEs and time-fractionation regimen, selecting tumors as candidates for NCT, and developing techniques for monitoring NCNs in vivo.

46217 BNCT project in Czechoslovakia. Burian, J. (Institute of Nuclear Research, Prague (Czechoslovakia)); Janku, I.; Kvitek, J.; Mares, V.; Prouza, Z.; Spurny, F.; Sourek, K.; Stibr, B.; strouf, O. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102--: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

In Czechoslovakia, a multidisciplinary research group for BNCT of human brain gliomas has been constituted in 1980. Mercaptoborane compound has been synthesized suitable for clinical use. The configuration of a thermal neutron beam with appropriate parameters has been created using the 10 MW VVR-S research reactor and proved experimentally. The realization of a technical project for a clinical pilot study could be expected by 1992.

46218 Proposed clinical trial studying the pharmacokinetics of B.S.H. Harkness, W.F.J. (Radcliffe Infirmary, Oxford (England)).

pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

There has been considerable interest in BNCT at Oxford for several years, which has been facilitated by the proximity of the clinical Departments of Neurosurgery and Radiotherapy as well as the Radiobiology unit and the Atomic Energy Research Establishment at Harwell. Each unit has been collaborating over this time with the end objective of a therapeutic facility at Harwell. In the Department of Neurosurgery, they are about to embark on a clinical study of the pharmacokinetics of a boron compound. This is a non-therapeutic trial as they cannot offer a neutron facility at Harwell as yet. Full approval of the Ethical Committee has been granted.

46219 Fractionation in boron neutron capture therapy. Durrant, K.R. (Churchill Hospital, Oxford (England)); Hopewell, J. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

In BNCT there are three major radiation products: the high-LET alpha particles of the $B(n,\alpha)Li$ reaction, the recoil protons from the incident neutron beam in non-borated tissue, and the low-LET gamma radiation, both from the treatment beam and from that induced in the reaction. Damage from the gamma radiation component is likely to be considerably reduced by fractionation. If a differential concentration of boron between tumor cells, normal nervous tissue cells and blood and endothelial cells is achieved, there would be a ten-fold differential dose to tumor versus normal tissue cells. Most radiation damage of non-borated tissue would arise from gamma radiation with the proton recoil effect dependent upon the energy of the neutron beam. The most significant difference between neutron and photon irradiation is the greater biological effectiveness of neutrons, associated with the reduction of repairable sublethal damage. These affect both total dose and fractionation. For very high-LET radiation, radiobiological data suggests that fractionation would not reduce radiation damage. However, data for neutron irradiation at c.16 MeV suggest that for both spinal cord and skin, the fractionation of the neutron dose of 4 to 6 fractions results in increased repair of sublethal damage, but that further fractionation would not reduce late radiation damage significantly.

46220 Dose fractionation in neutron capture therapy for malignant melanoma. Allen, B.J. (Australian Nuclear Science and Technology Organization, Menai, New South Wales); Brown, J.K. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Australia is entering a joint clinical trial with Japan for thermal neutron capture therapy of selected patients with superficial local recurrent, local advanced and isolated metastatic malignant melanoma. The para-boronophenylalanine (BPA) compound will be used with a neutron fluence of about 10^{13} neutrons per cm^2, to be delivered in a single dose. While in the initial trials of NCT, the single dose is a practical procedure; there may be advantages in dose fractionation, and these are considered in this paper.

46221 Thermal neutron capture therapy: The Japanese-Australian clinical trial for malignant melanoma. Allen, B.J. (Australian Nuclear Science and Technology Organization, Menai, New South Wales); Coates, A.S.; McCarthy, W.H.; Mameghan, H.; Mishima, Y.; Ichihashi, M. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Following the first NCT treatment for melanoma last year in Japan, it is planned to treat at least 12 patients during 1988, from Australia and Japan. Patients will be selected from those having evaluable superficial or subcutaneous local recurrence or isolated metastasis. In addition, selected Japanese patients with thick primary acral-lentiginous melanoma or superficially spreading melanoma that have poor prognosis with conventional therapy will be treated with NCT. Australian patients will be selected from those attending the Sydney Melanoma Unit at Royal Prince Alfred Hospital. They will have no detectable deep-seated distant metastases and should have an estimated life expectancy of at least 6 months. Locally recurrent or advanced melanoma are rare conditions, thanks to the increased awareness of the public and general practitioners and to the more stringent procedures adopted by surgeons.

46222 BNCT and dose fractionation. Russell, J.L. Jr. (Theragenics Corp., Atlanta, GA (USA)). pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Some portion of the radiation dose received by a patient during BNCT consists of primary and secondary gammas. The biological effect of that portion of the dose will depend upon the time history of the delivered dose. The well-known models for relating time-dose effects to clinical experience, are of questionable value in understanding dose effects in the time regime of a few hours, and for doses of less than tolerance. In order to examine the time-dose effect in the regime of interest to BNCT a simple phenomenological model was developed and normalized to the accepted body of clinical experience. The model has been applied to the question of fractionation of BNCT and the results are presented. The model is simply a linear healing model with two time constants. In other words, a first hit of radiation is assumed to wound (or potentiate) a cell. Given time, the cell will fully repair itself. If a second hit occurs before the cell has healed, the cell is killed. Apparently, there are two kinds of healing, one which occurs in 30 to 60 minutes, the other in two to four days. A small fraction of the cells will die on the first hit.

46223 Vascular factors affecting drug delivery to brain tumors. Tyson, G. (State Univ. of New York, Stony Brook (USA)); Fenstermacher, J.; Davis, R. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

This paper will briefly review the vascular factors that are important in selecting an agent for BNCT. In general, these particular factors - tumor blood flow and microvascular permeability - have not been considered critical limiting factors in BNCT. Although the normal cerebral capillary endothelium restricts the transfer of water-soluble drugs from blood to brain, the capillaries of malignant cerebral neoplasms are generally more permeable. Furthermore, blood flow in malignant brain tumors is generally normal or even increased, except in necrotic regions in which drug delivery is considerably less important. Unfortunately, these generalizations may be inadequate for any form of drug therapy which is delivered by the bloodstream and which seeks to entirely eradicate a malignant brain tumor. Available multi-modality treatment programs fail to achieve a cure despite the fact that they can eliminate more than 99.99% of a tumor. Thus, novel forms of therapy are not needed for the vast majority of the tumor cells. Instead, all new forms of therapy, including BNCT, must concentrate on the .01% of tumor cells which are presumably different enough to escape destruction.

46224 A proposed protocol for clinical trials of boron neutron capture therapy in glioblastoma multiforme. Dorn, R.V. III (EG and G Idaho, Inc., Idaho Falls (USA)); Spickard, J.H.; Griebenow, M.L. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). DOE Contract AC07-76ID01570. (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Neutron capture therapy (NCT) was suggested in theory as a treatment for malignant tumors some 50 years ago. Since then, considerable data have accumulated on the mechanisms of action and possible application of this technique. This paper outlines a protocol for a controlled study of the use of boron neutron capture therapy (BNCT) for the treatment of glioblastoma multiforme (GM). The protocol is one component of a comprehensive national BNCT research program at the Idaho National Engineering Laboratory (INEL) directed towards validating (or invalidating) NCT as a treatment for

human malignancies. This paper will address the following three points: provide a background of GM, as a tumor model, including current conventional treatment and research avenues; present an overview and framework of the clinical protocol, and introduce questions on research that may well impact the protocol before it is used, including possible additional tumor systems to be studied.

46225 A stochastic model for high-LET response for boron neutron capture therapy (BNCT). Wheeler, F.J. (EG and G Idaho, Inc., Idaho Falls (USA)); Griebenow, M.L.; Wessol, D.E.; Nigg, D.W.; Anderl, R.A. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). DOE Contract AC07-76ID01570. (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

There is evidence showing that there is a significant variation in tumor-boron and blood-boron concentrations for individual patients. There also is a wide variation in the size and location of the tumor. This diversity creates a situation in which treatment must be carefully tailored to the specific needs of each patient. A stochastic model is required for the $^{10}B(n,\alpha)^{7}Li$ effect. The application of such a model requires a microscopic biological-response function. Research and experience will be required before the models and response functions can be precisely quantified, but useful qualitative information on basic trends can be determined from simple models and trial response functions. This paper describes a proposed model based on the lineal response, which is very applicable to BNCT. The model is not limited to single-event response, but only requires the applicability of a response function which is independent of other events. Experiments support such a model for the $^{10}B(n,\alpha)^{7}Li$ reaction. This paper describes the model, provides details for basic charged-particle information and simulation methods, and provides a simple demonstration of the model's important by evaluating the endothelium tolerance to BNCT.

46226 Distributions of sulfhydryl borane monomer and dimer in rodents and monomer in humans: Boron neutron capture therapy of melanoma and glioma in boronated rodents. Slatkin, D.N.; Joel, D.D.; Fairchild, R.G.; Micca, P.L.; Nawrocky, M.M.; Laster, B.H.; Coderre, J.A.; Finkel, G.C.; Poletti, C.E.; Sweet, W.H. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

In this paper, boron distributions after infusion of monomer into two patients with malignant glioma are summarized. Preliminary studies are described of the effects of BNCT on intracerebral transplanted gliomas in rats infused with ^{10}B-enriched dimer and on subcutaneous transplanted mouse melanoma in mice infused with ^{10}b-enriched dimer or monomer. Distributions of ^{10}b in rats after prolonged intraperitoneal and intravenous infusions of the sulfhydryl boranes are also presented.

46227 A carboranyl porphyrin for boron neutron capture therapy of brain tumors. Kahl, S.B. (Univ. of California, San Francisco (USA)); Joel, D.D.; Finkel, G.C.; Micca, P.L.; Nawrocky, M.M.; Coderre, J.A.; Slatkin, D.N. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Many porphyrins are known to concentrate in tumor tissue both in vivo and in vitro, but the mechanisms of porphyrin-tumor affinity are unknown. A central theme of boron neutron capture therapy (BNCT) research is the search for boronated substances with high affinity for tumor. There is interest in the synthesis of boron-containing porphyrins and their evaluation for possible efficacy in BNCT. This study presents some modifications of a previously described method for synthesis of a particular nidocarboranyl porphyrin and some preliminary experimental indications of its potential usefulness for BNCT.

46228 Distribution of a boronated porphyrin in murine tumors. Kahl, S.B. (Univ. of California, San Francisco (USA)); Laster, B.H.; Koo, M.S.; Warkentien, L.S.; Fairchild, R.G. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

The authors have recently begun studying the boron distribution provided by a newly synthesized, water-soluble, non-toxic, boronated natural porphyrin (SBK-II). Multiple intraperitoneal injections (6 injections, 0.5 ml each, 3 per day over a 2-day period) with a total boron concentration of 20-50 μgB/gbw were administered to female BALB/cBNL mice bearing a Harding-Passey melanoma subcutaneously in the thigh. Boron distribution was determined at various time intervals following the last injection to allow an assessment of tumor uptake and clearance rate for blood and normal tissue. Concentrations of ^{10}boron in tumor and various organs were analyzed by the prompt-γ method. Continuous intravenous infusion techniques were also used to deliver boron to tumor, using the KHJJ mammary tumor model in BALB/c mice.

46229 Survival assays with a boronated porphyrin as measured with hamster V-79 cells in culture. Laster, B.H.; Kahl, S.B.; Popenoe, E.A.; Gordon, C.; Kalef-Ezra, J.; Fairchild, R.G. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

On the basis of their weight, boron-carrying capacity and propensity for tumor, porphyrins would appear to be the ideal carrier-molecules for use in boron neutron therapy (BNCT). In the past, problems such as toxicity, solubility and/or lability of the boron tag precluded the use of porphyrins for BNCT. However, a newly-synthesized boronated porphyrin appears to have surmounted these problems and, in preliminary in vitro studies, SBK-II has demonstrated biological efficacy. Preliminary data will be presented here comparing SBK-II with the monomeric (BSH) and dimeric (BSSB) forms of the sulfhydryl boron hydride currently being considered for use in BNCT clinical trials in the US.

46230 Neutron capture therapy for melanoma. Coderre, J.A.; Glass, J.D.; Micca, P.; Fairchild, R.G. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

The development of boron-containing compounds which localize selectively in tumor may require a tumor-by-tumor type of approach that exploits any metabolic pathways unique to the particular type of tumor. Melanin-producing melanomas actively transport and metabolize aromatic amino acids for use as precursors in the synthesis of the pigment melanin. It has been shown that the boron-containing amino acid analog p-borono-phenylalanine (BPA) is selectively accumulated in melanoma tissue, producing boron concentrations in tumor that are within the range estimated to be necessary for successful BNCT. The authors report here the results of therapy experiments carried out at the Brookhaven Medical Research Reactor.

46231 Tumor-seeking compounds for boron neutron capture therapy: Synthesis and biodistribution. Gabel, D. (Univ. of Bremen (West Germany)). pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

A successful application of boron neutron capture therapy towards the treatment of human malignancies relies on two prime conditions: the delivery of a sufficient amount of neutrons to the target volume, and the delivery of a sufficient amount of boron to the target cells. It must therefore be the aim of the chemist to synthesize tumor-localizing compounds that are able to target all tumor cells, and preferentially such compounds that are internalized by the cells. For a realistic chance of a successful therapy, it might be necessary to administer several compounds that accumulate through independent routes, and thus are able to reach all cells of the tumor. To be able to predict the outcome of a clinical therapy trial with a given boron concentration, it will be necessary to know the location of boron on an intracellular scale. The authors developed a method that allows for the analysis of boron in tissue sections. This method, Quantitative Neutron Capture Radiography (QNCR), utilizes

the selective sensitivity of cellulose nitrate films to the particles generated by the neutron capture reaction in boron.

46232 Boron-11 magnetic resonance imaging and spectroscopy; Tools for investigating pharmacokinetics for boron neutron capture therapy. Kabalka, G.W. (Univ. of Tennessee Institute for Biomedical Imaging, Knoxville (USA)); Bendel, P.; Davis, M.; Slatkin, D.N.; Micca, P.L. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). DOE Contract FG05-86ER60434. (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

MRI and MRS have the capability of providing in vivo information concerning the identity, quantity, and environment of drugs and other physiologically important materials. Significantly, the information is provided in three dimensional space which permits precise, non-invasive localization of the agent of interest. Since boron-11 and boron-10 are magnetically active, MRI and MRS are potentially valuable techniques for evaluation of BNCT agents in vivo. The authors present preliminary MRI and MRS measurements of the sulfhydryl dodecaborane dimer ($B_{24}H_{22}S_2^{-4}$), which include the first boron-11 image of a BNCT agent and the first boron-11 spectrum of a BNCT agent measured in an intact animal.

46233 Selective thermal neutron capture therapy and diagnosis of malignant melanoma: From basic studies to first clinical treatment. Yutaka Mishima (Kobe Univ. School of Medicine (Japan)); Masamitsu Ichihashi; Susumu Hatta; Chihiro Honda; Akihiro Sasase; Keizo Yamamura; Keiji Kanda; Tooru Kobayashi; Hiroshi Fukuda. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

As melanoma genesis occurs in pigment cells, accentuated melanogenesis concurrently occurs in principle. Thus, harnessing this accentuation of melanogenesis, the authors developed a new mutually-dependent two-step therapy, in which melanogenesis-seeking compounds first specifically target melanoma cells, enabling the powerful second step to selectively destroy the targeted cells. Their new thermal neutron capture therapy (NCT) uses a ^{10}B-dopa(melanin substrate) analogue, ^{10}B1-p-boronophenylalanine (^{10}B1-BPA) which accumulates preferentially in melanoma cells. The cells then are irradiated with thermal neutrons to induce the ^{10}b(n, α)^{7}Li reaction which releases energy of 2.33 MeV to a distance of 10-14μ, the diameter of melanoma cells. Extensive in vitro and in vivo radiobiological analysis confirmed the highly enhanced killing effect of ^{10}b1-BPA. Measurements of the accumulating capacity of ^{10}b1-BPA into melanoma cells in vitro and in vivo using both chemical and prompt gamma ray spectrometry assay showed its high affinity for these cells.

46234 Blood-brain-barrier impairment after irradiation: Implication in boron neutron capture therapy. Gregoire, V. (Universite Catholique de Louvain, Brussels (Belgium)); Keyeux, A.; Wambersie, A. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

The rationale of boron neutron capture therapy (BNCT) in brain tumors rests on the assumption that the boronated compounds will not be incorporated in the normal CNS protected by the tight blood-brain barrier (BBB) but will enter the tumor at the level at which the BBB is impaired. If fractionation is to be used in BNCT, or if BNCT would follow external radiotherapy, the question is: to what extent could the fractions (or the previous treatment) alter the BBB? To answer this question, it is necessary to assess the integrity of the BBB after different levels of absorbed dose and different time intervals. A brief summary of the structure and physiology of the BBB in the normal brain and tumor will be presented first, followed by a review of the published data concerning alteration of the BBB after cerebral irradiation.

46235 Implications of genotypic and microenvironmental heterogeneity for the cure of solid tumors by neutron capture therapy. Rockwell, S. (Yale Univ. School of Medicine, New Haven, CT (USA)). pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

There is increasing evidence for genotypic, phenotypic, and microenvironmental heterogeneity within solid tumors in experimental animals and in humans. This heterogeneity influences the response of the tumors to treatment with radiation, cytotoxic drugs, hyperthermia, and immunotherapy, and may also influence the efficacy of neutron capture therapy. This paper reviews the data on heterogeneity in solid tumors and considers the implications of these data for curative NCT.

46236 Status report on the development of a spallation neutron source for neutron capture therapy (NCT). Conde, H. (Uppsala Univ. (Sweden)); Grusell, E.; Larsson, B.; Ramstrom, E.; Ronnqvist, T.; Sornsuntisook, H.; Villa, S.; Crawford, J.; Reist, H.; Dahl, B.; Sjostrand, N.G.; Russel, G. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

The aim of the present study is to construct an accelerator-based intermediate-energy neutron source that would permit irradiation of neoplasms in the central nervous system by an intermediate-energy fluence rate of at least 10^9 n $\times$ cm^{-2} $\times$ s^{-1} in fields of 4-8 cm in diameter. The accelerator should be of a moderate size to permit accommodation in a hospital environment. In the first instance, a prototype source has to be designed that could be conveniently tested in a laboratory dedicated to radiation research, where the measurements here reported were performed. A tentative strategy is to accept a dose fraction due to neutrons above the energy range usually considered for intermediate-energy neutron therapy. Fast neutron therapy is an accepted therapeutic modality. The practical consequence of such a strategy would be that filtration of the moderated neutron beam would not be required. The work on the project has so far been devoted to studies of different moderator materials and configurations in combination with neutron production by 72 MeV protons stopped in heavy materials. The aim has been to optimize the performance of a neutron source for NCT. The required characteristics are firstly that the bulk of the neutrons should have an energy between 1-100 keV and secondly that the dose of the moderated beam should be of the order of 10^{13} $\times$n/cm^2 delivered in a time of approximately 3 hours.

46237 Uptake of boron into human gliomas of athymic mice and into syngeneic cerebral gliomas of rats after intracarotid infusion of sulfhydryl boranes. Joel, D.D.; Slatkin, D.N.; Micca, P.L.; Nawrocky, M.M.; Dubois, T.; Velez, C. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Effective boron neutron capture therapy (BNCT) of brain tumor will be dependent upon the use of boron-transport agents that give adequate levels of ^{10}B in tumor tissue but low boron concentrations in blood and normal brain. Several ^{10}B-transport agents are being studied in animals, however, only the sulfhydryl borane monomer ($Na_2B_{12}H_{11}SH$) is current used (in Japan) for the treatment of human malignant gliomas. Their studies show that after the administration of the sulfhydryl borane dimer ($Na_4B_{24}H_{22}S_2$) tumor boron concentrations are significantly higher than those obtained following the administration of equal amounts of boron as monomer. This report presents preliminary results on: (a) the uptake of monomer and dimer in tumors arising from a human malignant glioma-derived cell line inoculated subcutaneously in athymic (nude) mice; and (b) the comparison of intracarotid and intravenous infusion of monomer and dimer on the resultant boron concentrations in cerebral gliomas of rats.

46238 Toxicities of $Na_2B_{12}H_{11}SH$ and $Na_4B_{24}H_{22}S_2$ in mice. Marshall, P.G. (Memorial Hospital, Pawtucket, RI (USA)); Miller, M.E.; Grand, S.; Micca, P.L.; Slatkin, D.N. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.;

Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

The sodium salt of the anionic icosahedral borane ($B_{12}H_{11}SH^{2-}$) is used clinically in Japan, as a ^{10}B transport agent for boron neutron capture therapy (BNCT) of brain tumors. Although the dimer of that borane has greater affinity to a transplanted murine melanoma and to a transplanted rat glioma than does the parent monomer, the toxicity of the dimer has been cited as a factor that might limit its usefulness for BNCT clinically. Thus, it was considered appropriate to assess the relative severity of the toxic effects of the monomer and the dimer in mice.

46239 (IABG-B-SZ–1506/01) **Efficiency analysis of MR-imaging (investigations accompanying clinical tests) - work carried out so far. Interim report.** Ostheimer, E.; Feucht, H. Industrieanlagen-Betriebsgesellschaft m.b.H., Ottobrunn (Germany, F.R.). Haputabteilung Zentrale Studinen; Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.); Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). 1987. 105p. (In German). Contract BMFT 01VF164;IABG 263 7138 00. Available from Copy held by UB/TIB Hannover.

At first the study tasks are presented. Then the work carried out so far is described. Thereby it is shown, how fundamental considerations concerning health economics influenced the progress of the study. A concept of data collection in clinics is developed. A pattern of forms suited for data collection is given in the annex. Then the present state of MRI application is discussed with respect to performance, health risks, indications, operating conditions, economics, need of MR devices and planning of MR supply. The results obtained in this investigation were prepared to be extended towards a multi-center-study (which is taken into considerations by the Federal Ministry of Research and Technology). (orig.) With 51 refs., 8 tabs., 6 figs.

46240 (IAEA-TECDOC–506) **Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.** International Atomic Energy Agency, Vienna (Austria). May 1989. 239p. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

An Advisory Group Meeting devoted solely to review the atomic and molecular data needed for radiotherapy was held in Vienna from 13 to 16 June 1988. The following items as related to the atoms and molecules of human tissues were reviewed: Cross sections differential in energy loss for electrons and other charged particles. Secondary electron spectra, or differential ionization cross sections. Total cross sections for ionization and excitation. Subexcitation electrons. Cross sections for charged-particle collisions in condensed matter. Stopping power for low-energy electrons and ions. Initial yields of atomic and molecular ions and their excited states and electron degradation spectra. Rapid conversion of these initial ions and their excited states through thermal collisions with other atoms and molecules. Track-structure quantities. Other relevant data. Refs, figs and tabs.

46241 (IAEA-TECDOC–506, pp. 51-72) **Need for improving the accuracy in dose delivery in radio- and neutron therapy: Importance of atomic and molecular data.** Wambersie, A (Louvain Univ., Brussels (Belgium). Cliniques Universitaires St. Luc); Dam, J. van; Hanks, G.; Mijnheer, B.J.; Battermann, J.J. International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

In photon therapy, an accuracy of 3.5% in absorbed dose delivery to the dose specification point is required. It corresponds to one relative standard deviation, combining types A and B uncertainties (i.e. random and systematic, respectively). This requirment results from the steepness and the separation of the dose-response curves observed for tumour control and normal tissue complications. For both types of effects, the available clinical data are reviewed. Besides the accuracy requirement in dose level, the problem of dose distribution (or "geometry problem") is considered, and the possible consequences of an inaccuracy in patient/beam positioning are discussed. Examples taken from the "Patterns of care study" are presented, i.e. for prostatic adenocarcinoma and Hodgkin's disease. In fast neutron therapy, the required accuracy is at least as high as that required with photons. As a matter of fact, the same steepness of the dose-response curves is observed for tumour control and normal tissue complications. In addition, the physical selectivity is more critical with neutrons since a general reduction of the differential effect between cell populations has been observed after high-LET compared to low-LET radiation. The rationale for using protons and other heavy charged particles is presented. Additional basic physical data are needed for improving the accuracy in dose level as well as in physical selectivity, especially for neutrons and heavy charged particles. They are needed in order to evaluate more accurately the kerma and absorbed dose in different human and biological tissues, to determine the response of different detectors, and also to optimize the beam collimation systems and thus improve the physical selectivity of the irradiation. (author). 39 refs, 7 figs, 18 tabs.

46242 (IAEA-TECDOC–506, pp. 72-79) **Parameters characterizing charged particle track structures.** Paretzke, H.G. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Inst. fuer Strahlenschutz). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

It is well-known in radiation research that a profound knowledge of the spatial distribution of localized new chemical species produced in matter upon radiation interaction, i.e. the track structure, represents an indispensable prerequisite for the understanding of physical, chemical and biological actions of ionizing radiation. This can easily be shown by the fact that the same dose absorbed from different radiation fields can have different types and/or magnitudes of effects. Charged particle track structures evidently are characterized by joint probability functions describing the locations and types of new species at a given time; they thus represent the initial boundary condition for all subsequent reactions in the affected sector of the irradiated matter and describe it fully at later stages. However, such full descriptions are too complicated in a mathematical sense and, thus, coarser classification quantities have been searched for and introduced. Although major scientific activities are required to improve our knowledge on (a) processes of energy transfer from radiation to matter; (b) chemical modifications of target molecules by the absorbed energy; (c) non-homogeneous biochemical reactions in particle track at early times; (d) identification of parameters characterizing track structures regarding their similarities and dissimilarities with respect to the subsequent reactions, this paper discusses only the specific research needs to improve the scarce present knowledge on parameters characterizing charged particle track structures in matter. (author). 15 refs, 11 figs.

46243 (IAEA-TECDOC–506, pp. 91-105) **Atomic data required in accurate measurements of kerma for neutrons with low pressure proportional counters.** Pihet, P. (Universitaet des Saarlandes, Homburg/Saar (Germany, F.R.). Fachrichtung Biophysik und Physikalische Grundlagen der Medizin); Menzel, H.G. International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

The accuracy achievable in neutron dosimetry for radiation therapy critically depends on the knowledge of the kerma factors for the tissue components and the detector materials. Gas filled cavity

chambers allow to achieve relatively accurate measurements of kerma for the chamber wall material. Ionisation chambers and proportional counters measure with high precision the charge from ionisation produced in the gas by the charged particles released in neutron interactions with the wall and with the gas. However, the overall uncertainty of the kerma measurement depends on the quality of the basic physical data required in the application of the cavity chamber principles, in particular, W-values, stopping powers and stopping power ratios for the charged particles released and their energy dependence. The paper summarizes the experience gained in evaluating atomic data to be used in cavity chamber principles for neutron kerma measurements with tissue-equivalent and non hydrogenous proportional counters. Proportional counters with walls made of A-150 TE plastic, graphite, Al, Mg, Fe, Zr and ZrO have been used to measure neutron kerma factors by several groups. Different mixtures such as methane based TE gas, propane based TE gas or CO_2 were used as counting gases. It is shown that the spectral information provided by the proportional counters can be used to assess quantities such as the gas-to-wall absorbed dose conversion factor. An attempt is made to assess the uncertainties in kerma measurements due to the uncertainties of basic atomic data. (author). 40 refs, 12 figs, 5 tabs.

46244 (IAEA-TECDOC–506, pp. 105-116) **Energy deposition in the nanometer sites based on the track structure calculations.** Olko, P. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Medizin); Booz, J.; Paretzke, H.G.; Wilson, W.E. International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

In this paper microdosimetric and radial dose distributions, calculated with track structure codes Moca-8 and Moca-14 for different radiation types are presented and compared with existing experimental data. The energy deposition and ionization spectra for low site diameters are shown and the conversion factors between energy deposition and ionization are given. The influence of atomic and molecular data used by the codes on the results is briefly discussed. (author). 30 refs, 8 figs, 2 tabs.

46245 (IAEA-TECDOC–506, pp. 117-127) **Interpretation of radiobiological experiments performed with heavy charged particles.** Kraft, G. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

In heavy ion experiments, a large body of radiobiological data, (cross sections for cell inactivation and mutation, induction of both chromosome aberrations, and of strand breaks of DNA) has been measured for different atomic numbers, from helium (Z=2) to uranium (Z=92), and at energies between 1 and 1000 MeV/u which covers an LET range from 10 to 16,000 keV/μm. These data exhibit a common feature: At LET values below 100 keV/μm all data points of one specific effect form one single curve as a function of LET, independent of the atomic number of the ion. In this LET range, the biological effects are independent from the particle energy or track structure and depend only on the energy transfer. Therefore, LET is a good parameter in this regime. For LET values greater than 100 keV/μm, the curves for the different ions separate from the common curve in order of increasing atomic numbers. In this regime LET is no longer a good parameter and the physical parameters of the formation of particle tracks are important. The similarity of the σ-LET curves for different endpoints shows that the 'hook-structure' is produced by physical and chemical effects which occur before the biologically relevant lesions are formed. For this part of the reaction chain only a very limited amount of data is available. This is especially true for the emission of delta electrons. There, the energy and angular distribution of the electrons in a solid target has to be measured. Data on the interaction of the electrons and the positive deficiencies are required. The energy dependence of the production of chemical lesions should be known as well as their recombination probabilities. (author). 30 refs, 13 figs, 2 tabs.

46246 (IAEA-TECDOC–506, pp. 131-136) **Ionization yield for low energy photons and electrons absorbed in tissue-equivalent gas mixtures.** Srdoc, D. (Institut Rudjer Boskovic, Zagreb (Yugoslavia)). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

The mean energy required to form an ion pair (W) was measured for photons having energy 0.277, 1.49 and 5.89 keV in two tissue-equivalent gas mixtures. Methane- and propane-based tissue-equivalent gases are essential in measurements of radiation energy deposition in small spheres simulating human cells. The dose distribution curves on the cell-size levels (0.1 - 10 μm sphere diameter) are indispensable in human radiotherapy, especially when neutrons and heavy particles are applied. The end effects and products of any kind of absorbed radiation in tissue are broken chemical bonds and free radicals, preceeded by low energy particles, e.g. slowed down electrons. Therefore, the knowledge of the average energy required to form an ion pair at very low particle energy is very important in the so called "bookkeeping" method of studying the particle energy degradation process. The W value for low-energy electrons was calculated from experimental photon W values. An increase of W values with decreasing energy is observed in accordance with the same trend, as presented in the ICRU Report No. 31. Good agreement between the calculated and the experimental W values is obtained in low-energy region, as well as for high energy W values. Our results fill the gap between the very low energy region (below 300 eV) and the high energy (above 10 keV) region. In addition to measuring the average W-values, the results obtained by our experimental method threw light on the statistical fluctuations in the ionization yield for low energy photons. It was found that the primary distribution of ion pairs in investigated gas mixtures is asymmetrical and more peaked than the Gaussian distribution for low energy incident photons, approaching the Gaussian shape for 6 keV photons. (author). 14 refs, 3 figs, 3 tabs.

46247 (IAEA-TECDOC–506, pp. 136-150) **Experimentally determined W values, stopping powers and ranges of low-energy protons and electrons in gases: Methods and problems.** Waibel, E. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.)). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

W values, stopping powers and ranges are fundamental atomic quantities in dosimetry, depending on the type of radiation, stopping material and energy. The information available on the average energy to produce an ion pair (W value) for protons and electrons in gases of interest is reviewed, particularly for proton energies above 1 keV and electron energies above about 20 eV. Emphasis is laid on experimentally determined stopping powers and ranges of protons and electrons in gases for that region of low energies where theoretical calculations are quite complex, giving higher uncertainties. Very few experimental data exist for energies below the stopping power maximum. To enable an adequate evaluation of spreading data resulting in recommended values, a careful analysis of uncertainties is needed. In some cases discrepancies far exceed the uncertainties quoted, and it may be supposed that the systematic deviations, depending on the method, are either not well known or not taken into account. The experimental methods are therefore discussed with respect to possible systematic uncertainties. (author). 72 refs, 14 figs.

46248 (IAEA-TECDOC–506, pp. 151-160) **Proton stopping in some oxygen compounds at intermediate energies: influences of chemical and physical state.** Bauer, P. (Johannes Kepler Univ., Linz (Austria). Inst. fuer Experimentalphysik); Mitterschiffthaler, C.; Paul, H.; Mertens, P. International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

For the therapeutical use of fast proton beams, a precise knowledge of the stopping power of pure elements and chemical compounds for protons is necessary, especially at the stopping power maximum. This maximum is found at a projectile velocity $v_1=(1.5\text{-}2.5)v_0$, depending on the velocity distribution of the slowest target electrons (Here, v_0 is Bohr's velocity). Unfortunately, the scatter of published stopping power data increases drastically with decreasing projectile energy: at and below the maximum, experimental errors are typically ~20%. In the course of the experimental cooperation between Berlin and Linz, we obtained precise stopping power data (accuracy +- 3%) for C,A1,Si,Ni,Cu,Ge,Ag and Au, for proton energies between 30 and 500 keV $(1.1\text{-}4.5)v_0$. For proton stopping cross sections in chemical compounds, deviations from simple additivity (i.e. from Bragg's rule) are expected where the valence electrons dominate the stopping process, i.e. at and below the stopping power maximum. Indeed, our measurements on $A1_2O_3$ and SiO_2 show deviations from Bragg's rule of 35% and 20%, resp., at $v=0.9\ v_0$, the stopping cross sections of the molecules being smaller than the added stopping cross sections of the constituents. This is in qualitative agreement with the fact that the valence electrons are bound more strongly in the molecule than in the atoms or gas molecules. The ratio of the stopping cross sections $\epsilon_{A1203}/\epsilon_{SI02}$ equals the ratio of the number of valence electrons (1.5) within ~2% in the proton energy range from 20 keV to 300 keV ($0.9\ v_0$ to $3.5\ v_0$), where contributions from core electrons are small. This leads to the interpretation that the valence electrons dominate the stopping process in the same way in both molecules. (Abstract Truncated)

46249 (IAEA-TECDOC–506, pp. 160-168) **Atomic and molecular processes of energy loss by energetic charged particles.** Toburen, L.H. (Battelle Pacific Northwest Lab., Richland, WA (USA)). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

Understanding the biological consequences of energy loss by charged particles, whether they are high energy therapeutic ion beams or ion recoils produced by neutron interactions in tissue, requires access to a wide range of atomic and molecular data. The relative biological effectiveness of different high LET radiations, as well as a detailed understanding of the chemical and biological damage initiated, depends on the spatial pattern and form of the energy deposited within the stopping media. For fast charged particles the primary means of energy deposition is ionization of the media with the spatial pattern determined by subsequent energy transport by secondary electrons. To provide detailed descriptions of the spatial pattern of energy deposition and energy transport along charged particle tracks requires a comprehensive knowledge of the cross sections for (1) the production of electrons, as a function of ejected electron energy and emission angle; (2) electron capture and loss by the moving ion; (3) the relative probability of multiple ionization processes, i.e., simultaneous production of two or more secondary electrons; (4) the interactions of secondary electrons with the constituents of the media; (5) for dissociative ionization/excitation of the molecular constituents of the media; and (6) the subsequent ion-molecule and excited state molecular energy transfer reactions within the stopping medium. This presentation will briefly review the status of our knowledge of differential and total ionization cross sections, discuss the availability of charged particle cross sections of interest in Radiological Physics, and describe some of the areas where data is urgently needed. 45 refs, 6 figs.

46250 (IAEA-TECDOC–506, pp. 169-179) **Electron collision cross-section measurements and data for gas phase molecules (atoms) of interest to radiotherapy.** Trajmar, S. (California Inst. of Tech., Pasadena, CA (USA). JET Propulsion Lab.). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

Detailed analysis and understanding of the early stages of radiation interaction with matter require the knowledge of pertinent electron-molecule collision cross sections. In spite of half a century of activities in this field and a recent increase in demands and efforts to generate cross section data, our knowledge still can be characterized only as fragmentary. In this paper the status of electron-molecule (atom) collision cross section data of interest to radiotherapy is briefly summarized in the low and intermediate-energy regions (about threshold to hundred eV impact energies). The emphasis is on data obtained from measurements carried out under single-collision conditions and associated with elastic scattering, momentum transfer, excitation (rotational, vibrational, electronic), and dissociation into neutral and charged fragments. Differential, integral and total electron collision cross section measurements and theoretical results are discussed and a projection of trends and expectations for the near future is attempted. The recent developments both in experimental and theoretical methods are very encouraging. The optimum approach to the generation of the very large body of data required is a joint experimental-theoretical effort. (Theoretical methods are not yet completely reliable and need experimental verifications. On the other hand, experimental determination of a detailed and complete set of cross sections is a difficult and tedious job; it is overwhelming in general and practically impossible in some cases.) (author). 63 refs, 5 figs, 1 tab.

46251 (IAEA-TECDOC–506, pp. 179-193) **Total and partial electron impact ionization and attachment cross-sections of atoms, molecules and clusters (quasi-liquids): A review of experimental and theoretical methods and data for radiotherapy.** Maerk, T.D. (Innsbruck Univ. (Austria). Inst. fuer Ionenphysik). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

Today's knowledge of accurate absolute ionization cross sections pertaining to radiotherapy originate mostly from rather recent studies. This review first summarizes recent developments of the principal experimental, semiclassical and semiempirical methods used for the absolute ionization cross section determinations. Moreover, a critical review will be given of the available experimental data for radiotherapy (partial and total electron impact ionization cross section functions). Finally, this review is particularly dedicated to the discussion of recent studies of the inelastic interaction of slow and fast electrons in quasiliquids and/or in quasisolids (i.e. electron attachment to and electron ionization in van der Waals clusters consisting of rare gases, N_2, O_2, H_2O, etc.). (author). 139 refs, 12 figs.

46252 (IAEA-TECDOC–506, pp. 193-199) **Electron collision cross-sections for atoms and molecules determined from beam and swarm data.** Hayashi, M. (Nagoya Inst. of Tech. (Japan)). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

This paper deals with the electron collision cross-sections for H_2O molecule needed as input for electron transport calculations and for the modeling of radiation effects in biological materials. Recently, some new beam data have been published for H_2O. With these

data we have improved the cross-section values. We have discussed the values of total ionization cross-sections, and it is concluded that the recent measured values of Orient et al are too large. (author). 28 refs, 5 figs, 3 tabs.

46253 (IAEA-TECDOC–506, pp. 200-214) **Fundamental processes in radiolysis - Collision dynamics data on some elementary processes.** Hatano, Y. (Tokyo Inst. of Tech. (Japan). Dept. of Chemistry). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

A brief survey is given of recent progress in understanding fundamental processes in radiolysis with special emphasis on the present status of the knowledge of their cross section data and its implications to that of the condensed phase. Topics are chosen from our recent investigations of some elementary processes: (1) "Energy deposit" on molecular compounds: absolute VUV-photoabsorption and photoionization cross sections, (2) Dissociation of superexcited molecules, (3) Penning ionization and its related processes, and (4) Electron attachment processes. (author). 71 refs, 8 figs, 3 tabs.

46254 (IAEA-TECDOC–506, pp. 214-218) **Charge transfer involving doubly charged ions: Low energy scattering experiments as a source of state-to-state relative cross-section data.** Herman, Z. (Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyzikalni Chemie a Elektrochemie J. Heyrovskeho); Vancura, J. International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

Single-charge transfer processes of doubly charged atomic and molecular ions are important elementary processes in ionized media. Their state-selective cross sections are in agreement with the "reaction window" concept. The possibility of obtaining state-to-state relative cross sections of these processes in the eV and sub-eV collision energy region from scattering experiments is discussed. (author). 20 refs, 4 figs.

46255 (IAEA-TECDOC–506, pp. 218-232) **Cross-sections for 0.025 eV-1 keV electrons and 10 eV-1 keV photons.** Terrissol, M. (Toulouse-3 Univ., 31 (France). Centre de Physique Atomique); Bordage, M.C.; Caudrelier, V.; Segur, P. International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

We present total and differential cross-section for ionization and excitation of every atomic or molecular energy level, following electron or photon impact on gases relevant for radiotherapy studies such as H, N, O, He, Ar, H_2, N_2, O_2, CO_2, CH_4 or H_2O. For photons, we present here a method to obtain photoionization cross-sections for molecules. For electron after a review on all interaction processes, we show total, differential or momentum transfer cross-sections for elastic scattering and selected molecules. The methods used to obtain or derive from experimental data these cross-sections are quickly presented or discussed as well as all bibliographic references. (author). Refs, 11 figs, 6 tabs.

46256 (IAEA-TECDOC–506, pp. 235-238) **Atomic and molecular data activities for fusion in the IAEA Nuclear Data Section.** Smith, J.J. (International Atomic Energy Agency, Vienna (Austria). Atomic and Molecular Data Unit). International Atomic Energy Agency, Vienna (Austria). May 1989. (CONF-8806231–: International Atomic Energy Agency (IAEA) advisory group meeting on atomic and molecular data for radiotherapy, 13-16 Jun 1988). In *Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988.* Order Number DE89635361/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

This paper provides some brief background information on the efforts devoted to the generation, compilation and evaluation of atomic and molecular data which are required for an understanding and interpretation of fusion plasmas. In particular, the role of the atomic and molecular data center network in the international coordination of activities will be emphasised. A summary of the data needs for fusion is given and recent references which define the current extent of the atomic and molecular data base are provided. (author). 23 refs.

46257 (INIS-SU–110/A, pp. 62-68) **Radionuclide diagnosis of metastatic skeleton tumors according to the examination of 2000 patients.** Zubovskij, G.A.; Smirnov, Yu.N. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The efficiency of scintiscanning examinations in diagnosis of skeleton metastatic injuries is determined. During scintiscanning it is possible to differentiate metastases from benign changes and to assess the activity of the pathological process. At the present development of scintiscanning it is impossible to determine nosological belonging of focal skeletal injuries. 7 refs.; 2 tabs.

46258 (INIS-SU–110/A, pp. 48-54) **Differential diagnosis of pathological processes in bram.** Lyass, F.M.; Shcherbakova, E.Ya.; Kotel'nikova, T.M. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Feasibilities of brain radioisotope γ-topography in development of differential diagnostic features of brain pathological processes were verified. A quantitative assessment of such parameters as relative buildup index, precise contour, biological characteristic was carried out. Tumoral location differ from nontumoral center by the quantitative characteristics. Comparison of quantitative criteria with anatomic topographic characteristic of the tumor center its shape and sizes considerably increase the reliability of diagnosis. 2 refs.; 1 tab.

46259 (INIS-SU–110/A, pp. 55-61) **Data of radionuclide cysternography for assessment of brain liquor system pathology.** Shcherbakova, E.Ya.; Lyass, F.M.; Sedov, V.V.; Soboleva, O.I.; Vorob'eva, E.N.; Prokof'eva, I.Sh.; Kotel'nikova, T.M. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

It is shown that radioisotope cysternography reveal pathological changes in brain liquor system, featuring its morphological and functional disturbances. Variability of radiological features directly depends on nosological form of the disease and doesn't depend of radiopharmaceutical type. 2 refs.; 1 tab.

46260 (INIS-SU–110/A, pp. 69-73) **Radionuclide diagnosis of bone system injuries in children.** Godin, V.P.; Aplevich, N.N. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Pecularities of polypositional skeleton scintiscanning with ^{99m}Tc-tin pyrophosphate in revealing primary bone system injuries in children were studied. In complex examination of children with primary and metastatic skeletal injuries performance of radioisotope examination is recommended as initial test to reveal pathological changes. The revealed suspicious centers must examined using roentgenological methods. Differences in localization pecularities of primary and metastatic skeletal injuries can not restrain from bone system scintiscanning. 5 refs.

46261 (INIS-SU–110/A, pp. 74-83) **Osteoscintigraphy in clinical practice.** Mechev, D.S. Institut Biofiziki, Moscow (USSR). 1988.

(In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Advantages and short comings of 2 osteotropic compounds ^{85}Sr and ^{99m}Te -pyrophosphate are given. Despite unsatisfactory physical parameters ^{85}Sr remains to be the only available really osteotropic compound. The necessity of searching new osteotropic preparations able to substitute ^{85}Sr is underlined. In all doubtful cases. It is recommended to initiate the examination using ^{85}Sr (as an aid in differential diagnosis) and then use ^{99m}Te-pyrophosphate (to get information of the degree of local and general dissemination of the process, to make dynamic observation, to control the degree of surgery efficiency). 1 tab.

46262 (INIS-SU–110/A, pp. 84-93) **Experience of positive scintigraphy of neoplasms of various localization.** Shishkina, V.V.; Mechev, D.S.; Tratsevskij, V.V.; Sinyuta, B.F.; Zamyatin, S.S.; Atamanyuk, N.P. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The acceptibility of radiopharmaceuticals is considered and indications for their usage to diagnose neoplasms of various localization are determined. Comparative experimental data on sensitivity, specific features and diagnostic information value of a number of tumorotropic radiopharmaceuticals in tumours of various localization are given. It shown that obvious stabilizaton of information value index of positive scintigraphy to be 80-85 %. 1 tab.

46263 (INIS-SU–110/A, pp. 94-102) **Combined radionuclide examinations in diagnosis of lung carcinoma.** Zajtseva, T.I.; Bogdasarov, Yu.B.; Afrikyan, M.N.; Karimova, L.Sh. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

It is shown that combined roentgeno-radioisotopic examination increases efficiency of differential diagnosis of malignant and benign tumors in the lungs. A feasibility of application of in vivo and in vitro examinations to control the state of patients as before operation and after surgical treatment in order to reveal recurrences and metastases is shown. 8 refs.; 2 tabs.

46264 (INIS-SU–110/A, pp. 103-107) **Positive scintigraphy with ^{67}Ga- and ^{111}In-bleomycin in diagnosis of neoplasms of peritoneal and retroperitoneal space.** Bogdasarov, Yu.B.; Zajtseva, T.I.; Prorokov, V.V.; Labunets, I.N. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

It is shown that positive scintigraphy may give additional data in doubtful case in diagnosis of neoplasms of small and large intestine. Application of scintigraphy to reveal metastases in upper abdominal and retroperitoneal lymph nodes is presented to be of special impertance, for such metastases can be hardly diagnosed by present non-isotopic methods. 9 refs.

46265 (INIS-SU–110/A, pp. 114-120) **^{111}In-citrine in clinical oncology.** Tarasenko, Yu.I.; Korsunskij, V.N.; Naumenko, A.Z.; Kosheleva, I.Yu. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Experimental studies of ^{111}In-citrine pharmokinetics showed satisfactory conditions for tumor imaging and gave substantiation for optimal methodical determination. Application of ^{111}In-citrine in 35 patients showed it's tropism to malignant tumors of various localization and histological structure. ^{111}In-citrine is of extreme value in diagnosis of tumors in the zone above diaphragm and in maxillofacial zone. ^{113}In-citrine enables to image not only primary tumors but also metastatic process and to reveal symptoms of tumoral growth and recurrences of the disease. 7 refs.

46266 (INIS-SU–110/A, pp. 121-127) **Complex in vivo - in vitro examination in case of mammary gland neoplasm.** Korsunskij, V.N.; Lapshin, V.P.; Naumenko, A.Z.; Kolpakov, I.S.; Borisov, E.A.; Tarasenko, Yu.I.; Gonina, L.I. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The results of scintiscanning of skeleton and data obtained by radioimmunoassay in patients with mammary gland neoplasms were compared. The experiments showed expediency of complex examinations in vivo and in vitro to reveal the dissemination in case of mammary gland tumours. Increase of concentration of parathyrine, prolaction, carcinoembryonic antigen in case of scintiscanning reveoding of intraosseous pathology. Not confirmed by roentgenological examinations can promote early diagnosis and differential diagnosis in metastatic skeleton injury and considerably correct treatment in such patients. 6 refs.; 1 tab.

46267 (INIS-SU–110/A, pp. 128-137) **Polyradionuclide diagnosis of lung neoplasm.** Fadeev, N.P.; Barchuk, A.S.; Keller, Yu.M. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

A clinical assessment of complex radioisotope examination of lungs in patients with suspicion of bronchogenic-neoplasm was developed. Application of various scintigraphic methods and their complexes was recommended to define precisely the character of revealed roentgenological pathological shadows of doubtful genesis in the lungs, to determine a degree of local dissemination of lung tumor on the vessels lymph nodes; to reveal lung cancer recurrences, to assess the efficiency of radio- and chemotherapy. 7 refs.; 2 tabs.

46268 (INIS-SU–110/A, pp. 138-142) **^{131}I-cholesterol scintigraphy in diagnosis of lung metastases into adrenal glands.** Zubov, G.S.; Keller, Yu.M.; Matytsin, A.N. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

A comparative study of scintiscanning of adrenal glands using ^{131}I-cholesterol and suprarenomography in diagnosis of metastatic adrenal injury in case of lung cancer was performed. It is shown that scintigraphy using ^{131}I-cholesterol is a method permitting to choose effectively patients for final stage of diagnosis of delayed metastases in case of lung cancer. According to priliminary experience indication to suprarenoscintiscanning using ^{131}I-cholesterol is considerable local dissemination of bronchogenic cancer. 6 refs.; 1 tab.

46269 (INIS-SU–110/A, pp. 143-155) **Radionuclide diagnosis of occult metastases of mammary gland tumours.** Fadeev, N.P.; Dymarskij, L.Yu.; Bat'ko, V.P.; Chebykin, I.A. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Information value of scintiscanning in revealing of latent metastatic skeleton and liver injuries in patients with mammary gland cancer was studied. Concrete indications for purposeful and effective application of the methods at different stages of examination and treatment of these patients were developed. It is shown that scintiscanning as the most sensitive method in revealing latent metastases of mammary gland cancer can be used as a criterion in application of complex of clinical laboratory, ultrasonic, computerized tomographic and radioisotopic methods in examination of liver. 9 refs.; 5 tabs.

Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). Feb 1989. 28p. (In Spanish). Order Number DE89636376/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Radiation applications in the area of biological sciences at our institution aim in the first place at the preservation and improvement of health through the development of research directed to diagnosis and therapeutics. The multiple aspects of biotechnology turn possible also classical and new applications of great importance for the community. The biomedical radiation applications performed particularly at the IPEN are summarized. (author).

46272 **In-vivo method for determining and imaging temperature of an object/subject from diffusion coefficients obtained by nuclear magnetic resonance.** LeBihan, D.; DeLannoy, J.; Levin, R.L. To Department of Health and Human Services, Washington, DC. USA Patent 7-234,101. 19 Aug 1988. 36p. Available from NTIS, PC A03/MF A01.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of application available NTIS.

A method of determining and imaging the temperature or the temperature change of an object (human, animal, liquid, or solid) by nuclear magnetic resonance of molecular diffusion coefficients is presented. Because of the noninvasive, nondestructive and nonionizing properties of nuclear magnetic resonance, this invention may be employed in an object or an animal continuously.

46273 (INIS-mf–11527) **Commercial trials on irradiation preservation of onions under tropical conditions.** Khan, I.; Sattar, M.; Wahid, M.; Ahmad, A.; Jan, M. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jan 1988. 4p. Order Number DE89636349/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

NIFA annual report 1987-88.

The present studies for preservation and storage of life of onion on commercial scale using gamma irradiation are being carried out. According to the survey the price of onion varies during the year. The results of the previous two years studies revealed that irradiation with 0.1 KGy and subsequent storage at ambient conditions under the shade enhanced the marketable life of bulks upto about 6 months as compare to 2 months at low temperature storage. It was observed that sprouting was relatively faster and higher in the red variety than other variety. Irradiation treatment significantly decreased weight losses in both the varieties. The higher weight loss in un-irradiated onion was primarily the result of greater rate of evaporation in the sprouted bulks as compared to unsprouted (irradiate) onions. (orig./A.B.).

46274 (INIS-mf–11528) **Radiation preservation of dry fruits and nuts.** Wahid, M.; Sattar, A.; Jan, M.; Ahmad, A.; Khan, I. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jan 1988. 8p. Order Number DE89636350/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

NIFA annual report 1987-88.

Dried fruits are considered a major source of income and foreign exchange in many countries. The spoilage of dried fruits and nuts by insect infestation, colour deterioration and chemical changes during storage are the serious problems especially under humid tropical conditions. The present work was undertaken to study the effect of irradiation in combination with different modified storage environments on insect infestation as well as chemical and sensory quality indices. The affect of gamma radiation dose of 1 KGy and storage environments such as air vacuum and carbon dioxide on insect infestation of dry fruits and nuts. In the case of un-irradiated samples, insect infestation progressed throughout the storage period especially in those kept under air. The vacuum storage was found better in checking infestation followed by CO/sub/2 and air. (orig./A.B.).

46275 (AD-A–207913/5/XAB) **Measurement of the radiosensitivity of rat marrow by flow cytometry. Scientific report.** McCarthy, K.F.; Hale, M.L. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 6p. (AFRRI-SR–89-8). Available from NTIS, PC A02/MF A01.

Pub. in Pharmacology and Therapeutics, Vol. 39, 79-83(1988).

Monoclonal antibodies directed against the three major glycoproteins of rat thymocytes were found to be useful for identifying hematopoietic stem cells by flow cytometry. These antibodies and their specificities are OX-7, which recognize a determinant expressed on the Thy 1.1 membrane glycoprotein; OX-22, which recognizes the high molecular weight form of the leukocyte common antigen; and W3/13, which identifies some leukocyte sialoglycoproteins. In previous studies, (McCarthy Et al., 1985, 1987; Hale et al., 1987) it was determined that the rat hematopoietic stem cell (HSC), colony-forming unit spleen (CFU-S), and prothymocyte had the phenotype of OX-7 upper 20% positive (OX-7up20%) and OX-22. This subpopulations could be further divided into two further subpopulations, a W3/13 dim and a W3/13 positive population, each representing approximately 0.17% of the total marrow cell population. Ongoing research indicates that the HSC is W3/13 dim. The agreement between the clonogenic CFU-S and phenotypic flow cytometry assays for determining the size of the HSC compartment led the authors to attempt to measure the radiosensitivity fo the HSC by flow cytometry. The results of these experiments are compared with radiation survival curve generated using the classical CFU-S clonogenic assay for HSCs, which is generally used when estimating the protective effects of drugs against hematopoietic damage.

46276 (AD-A–207914/3/XAB) **Radioprotection by biological-response modifiers alone and in combination with WR-2721. Scientific report.** Patchen, M.L.; D'Alesandro, M.M.; Chirigos, M.A.; Weiss, J.F. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 9p. (AFRRI-SR–89-9). Available from NTIS, PC A02/MF A01.

Pub. in Pharmacology and Therapeutics, Vol. 39, 247-254(1988).

Even when used alone, glucan can function protectively and/or therapeutically in radiation-injured host. When used in this manner, 'radioprotective' potential appears to be limited to (Dose Reduction Factors) of 1.2 - 1.3. However, when used in combination with even low doses of traditional aminothiol radioprotectors such as WR-2721, glucan can additively or synergistically increase DRFs to 1.5 - 1.6. Such results suggest that not only better radioprotection but also reduced toxicity may be obtained by using low-to-modest doses of several radioprotective agents that act via different mechanisms. Furthermore, based on measurements of motor performance in mice, glucan even appears to reduce the behavioral toxicity of WR-2721. Glucan is only one of several macrophage-activating Biological Response Modifiers (BRMs) that have been demonstrated to be both hemopoietic stimulants and radioprotectors. Numerous other BRMs remain to be evaluated for these effects, and they may prove to be as good as or better than glucan as radioprotectors. As

more data accumulate, it appears that these agents (alone or in combination with other agents) are establishing their usefulness in the treatment and/or prevention of acute radiation injury.

46277 (AD-A-207915/0/XAB) **Post-irradiation glucan administration enhances the radioprotective effects of WR-2721. Scientific report.** Patchen, M.L.; MacVittie, T.J.; Jackson, W.E. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1989. 12p. (AFRRI-SR-89-10). Available from NTIS, PC A03/MF A01.

Pub. in Radiation Research, Vol. 117, 59-69(1989).

Based on murine survival studies, endogeneous hemopoietic spleen colony formation (E-CFU), and recovery of bone marrow and splenic granulocyte-macrophage colony-forming cells(GM-CFC), it was demonstrated that the postirradiation administration of glucan, an immunomodulator and hemopoietic stimulant, enhances the radioprotective effects of WR-2721. These effects appeared to depend on the sequential cell protection mediated by WR-2721 and hemopoietic repopulation mediated by glucan.

46278 (AD-A-207916/8/XAB) **Attenuation and cross-attenuation in taste-aversion learning in the rat: Studies with ionizing radiation, lithium chloride, and ethanol. Scientific report.** Rabin, B.M.; Hunt, W.A.; Lee, J. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1989. 11p. (AFRRI-SR-89-11). Available from NTIS, PC A03/MF A01.

Pub. in Pharmacology Biochemistry and Behavior, Vol. 31, 909-918(1989).

The pre-exposure paradigm was utilized to evaluate the similarity of ionizing radiation, lithium chloride, and ethanol as unconditioned stimuli for the acquisition of a conditioned taste aversion. Three unpaired pre-exposures to lithium chloride blocked the acquisition of a taste aversion when a novel sucrose solution was paired with either the injection of the same dose of lithium chloride or exposure to ionizing radiation (100 rad). Similar pretreatment with radiation blocked the acquisition of a radiation-induced aversion, but had no effect on taste aversions produced by lithium aversion, but not radiation- or lithium chloride-induced aversions. In contrast, preexposure to either radiation or lithium chloride attenuated an ethanol-induced taste aversion in intact rats, but not in rats with lesions of the area postrema. The results are discussed in terms of relationships between these three unconditioned stimuli and in terms of implications of these results for understanding the nature of the proximal unconditioned stimulus in taste aversion learning.

46279 (AD-A-207918/4/XAB) **Radioprotection by leukotrienes: Is there a receptor mechanism. Scientific report.** Walden, T.L.; Kalinich, J.F. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 7p. (AFRRI-SR-89-14). Available from NTIS, PC A02/MF A01.

Pub. in Pharmacology and Therapeutics, Vol. 39, 379-384(1988).

Leukotrienes are a class of biological mediators derived from arachidonic acid through the lipoxygenase pathway. Early studies showed that lipophilic factors capable of constricting smooth muscle and inducing anaphylaxis were produced in the guinea pig in response to cobra venom. Leukotrienes have pathological roles in inflammation and anaphylaxis, act as vasoactive agents, as chemotactic factors for neutrophils, and are more potent constrictors of smooth muscle than histamine. The lipoxygenase metabolites of arachidonic acid have not been as extensively characterized in terms of their cytoprotective and radioprotective properties as have the cyclooxygenase metabolites (prostaglandins, thromboxane, and prostacyclin). Research on the radioprotective properties of leukotrienes is limited by the expense and availability of pure compounds, and very little research has been done in this area thus far. Preliminary studies are presented here with the goal of discussing the current understanding of this problem and to introduce future research directions.

46280 (AD-A-207946/5/XAB) **Low-energy x-ray irradiation for electrophysiological studies.** Schauer, D.A.; Zeman, G.H.; Pellmar, T.C. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1989. 11p. (AFRRI-SR-89-12). Available from NTIS, PC A03/MF A01.

Pub. in International Jnl. of Radiation Applications and Instrumentation, Part A, Vol. 40, No. 1, 7-17(1989).

High-dose-rate acute whole-body exposures have been the main focus of radiobiology research conducted at the Armed Forces Radiobiology Research Institute (AFRRI) for many years. Extensive quantitative studies have been conducted analyzing behavioral effects, radiation-induced syndromes, and combined injury phenomena. Tolliver and Pellmar initiated a study to evaluate radiation damage to brain neurophysiology. A 50-kVp molybdenum target/filter x-ray tube was installed inside a lead-shielded Faraday cage. High-dose rates of up to 1.54 Gy/min (17.4-keV weighted average photons) were used to conduct local in vitro irradiations of the hippocampal region of guinea pig brains. Electrophysiological recordings of subtle changes in neuronal activity indicate this system is suitable for this application.

46281 (AECL-9504) **Progress report - Physics and Health Sciences - Health Sciences Section 1987 January 1 - June 30.** Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment; Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Aug 1987. 132p. (PR-PHS-HS-3). Order Number DE89635254/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

This report covers the third semi-annual period since the Research Company was reorganized. A highlight of the period was the first peer review of all the activities in Physics and Health Sciences by external examiners. The review was conducted in April by three separate Technical Review Committees (TRC) one for each of the three main areas: health sciences, nuclear physics and condensed matter physics. In all cases the TRCs gave strong support to our programs having a mandate to assess research programs with respect to (a) their quality and (b) their relevance to Canada. The principal programs reviewed were: DNA damage and repair mechanisms; synergistic effects of chemicals and radiation; the tritium RBE study; radiosensitivity of human bone marrow cells; radioprotective enzymes; radiation biochemistry; chemistry of oxazolinones, benzofuroxanes and cyclodextrins; myeloid leukemia in mice; tritium monitoring, and quality factors; metabolic modeling; neutron dosimetry; groundwater/contaminant modeling; sediment exchange and speciation; and atmospheric dispersion. Very considerable effort was spent on preparing a proposal for a centre of excellence in toxicology for presentation in March to the Premier's Council in the Province of Ontario. Although the proposal was not one of the 7 (out of 28) successful proposals, much useful preparatory work was done towards the establishing of a centre for health and environmental research on toxic agents.

46282 Delayed effects of neutron irradiation on central nervous system microvasculature in the rate. Goodman, J.H. (Ohio State Univ. College of Medicine, Columbus (USA)); McGregor, M.J.; Clendenon, N.R.; Gordon, W.A.; Yates, A.J.; Gahbauer, R.A.; Barth, R.F.; Fairchild, R.G. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). (CONF-8802102--: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

Pathologic examination of a series of 14 patients with malignant gliomas treated with BNCT showed well demarcated zones of radiation damage characterized by coagulation necrosis. Beam attenuation was correlated with edema, loss of parenchymal elements, demyelination, leukocytosis, and peripheral gliosis. Vascular disturbances consisted of endothelial swelling, medial and adventitial proliferation, fibrin impregnation, frequent thrombosis, and perivascular inflammation. Radiation changes appeared to be acute and delayed. The outcome of the patients in this series was not significantly different from the natural course of the disease, even though two of the patients had no residual tumor detected at the time of autopsy. The intensity of the vascular changes raised a suspicion that boron may have sequestered in vessel walls, resulting in selectively high doses of radiation to these structures, or that there may have been high blood concentrations of boron at the time of treatment. The potential limiting effects of a vascular ischemic reaction in Boron Neutron Capture Therapy (BNCT) prompted the following study to investigate the delayed response of microvascular structures in a rat model currently being used for pre-clinical investigations.

46283 The effect of ionizing radiation on the blood-brain-barrier (BBB): Considerations for the application of boron neutron capture therapy (BNCT) of brain tumors. Dorn, R.V. III (EG and G Idaho, Inc., Idaho Falls (USA)); Spickard, J.H.; Griebenow, M.L. pp. 370 of Clinical aspects of neutron capture therapy. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.) Plenum Press, New York, NY (USA) (1988). DOE Contract AC07-76ID01570. (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), 1-2 Feb 1988).

All methods of boron neutron capture therapy (BNCT) in use or envisioned for treatment of brain tumors have, as an inseparable component, an element of ionizing radiation. This paper reviews data on the effects of ionizing radiation on the blood-brain-barrier (BBB) and the blood-tumor-barrier (BTB) and the potential impact of the effects on the delivery techniques of BNCT. This paper has the following objectives: review the available technique for BNCT of brain tumors; review the literature on experimental and human studies regarding the effects of ionizing radiation on the BBB; discuss the impact of these effects on the fractionization question for BNCT; and draw conclusions from that information.

46284 (CONF-8806237–) **DOE/CEC [Department of Energy/Commission of the European Communities] workshop on critical evaluation of radiobiological data to biophysical modeling.** USDOE Office of Energy Research, Washington, DC (USA). Office of Health and Environmental Research; Commission of the European Communities, Brussels (Belgium). [1988]. 47p. Sponsored by U.S. DOE Energy Research. From DOE/CEC workshop; 22-24 Jun 1988. Order Number DE89015214/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Department of Energy's Office of Health and Environmental Research and the Commission of the European Communities (CEC) Radiation Protection Program support the majority of Research in the Field of Radiobiological Modeling. This field of science develops models based on scientifically sound principles to predict biological response (at the cellular, molecular, and animal level) to exposure to low level ionizing radiation. Biophysical models are an important tool for estimating response of ionizing radiation at low doses and dose rates. Generally speaking, the biophysical models can be classified into two groups: (1) mechanistic models and (2) phenomenological models. Mechanistic models are based on some assumptions about the physical, chemical, or biological mechanisms of action in association with radiobiological data whereas the phenomenological models are based solely on available experimental data on radiobiological effects with less emphasis on mechanisms of action. There are a number of these models which are being developed. Since model builders rely on radiobiological data available in the literature either to develop mechanistic or phenomenological models, it is essential that a critical evaluation of existing radiobiological data be made and data that is generally considered good and most appropriate for biophysical modeling be identified. A Workshop jointly sponsored by the DOE and the CEC was held at Oak Ridge, Tennessee from June 23–25, 1988, to review the data available from physical and chemical, cellular and molecular and animal studies with ionizing radiation.

46285 (CONF-8904261–1) **Experimental radiobiology and radiation protection studies.** Fry, R.J.M. Oak Ridge National Lab., TN (USA). 1989. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From National Council on Radiation Protection and Measurements (NCRP) annual meeting; 5 Apr 1989. Order Number DE89015969/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In the past the contribution of experimental animal data to the risk estimates for external radiation carcinogenesis has been limited. In the future the contribution will have to be greater if the influence of dose rate and radiation quality on radiation-induced cancer are to be assessed. It is important that accepted methods of extrapolation of risk estimates across species are developed and there appear to be some methods with promise. The study of mechanisms of radiation carcinogenesis are central to experimentalists' studies and the understanding of the mechanisms will help to formulate better models, for example, of dose-response relationships but such studies will not solve all the problems of risk estimation. 27 refs., 6 figs.

46286 (DOE/NV/10630–T2) **A curriculum model for Nevada Test Site radiation protection technician training.** Petullo, C.F. Nevada Univ., Las Vegas, NV (USA). May 1989. 72p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-89NV10630. Order Number DE89015931/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

A research project was undertaken to develop a performance-based curriculum model for Nevada Test Site Radiation Protection Technicians. The study began with an overview of Radiation Protection Technician training curricula within the Department of Energy (DOE) Government Contractor system and the Training Accreditation Manuals used for program evaluation of DOE system training programs. The research design included data from a two page questionnaire. Further data were provided from other Radiation Protection Technician training programs within the DOE system. The developed model utilized a five-phase/step approach to curriculum design encompassing (1) needs analysis, (2) designing the training process, (3) development of curriculum and support materials, (4) training implementation, (5) training evaluation. The Needs Analysis determined the specific material to be covered in the training program. Designing the Training Process involved choosing, from the core/generic job tasks identified in the Needs analysis, the specific knowledge and skills learning objectives for the program. Development of Curriculum and Support Materials involved choosing the method of instruction, identifying which tasks would be taught on-the-job and designing the qualification standard and lesson plans for the tasks. 24 refs., 6 figs., 3 tabs.

46287 (EGG-BNCT–8353-Vol.3-No.3) **PBF/BNCT [Power Burst Facility/Boron Neutron Capture Therapy] program for cancer treatment: Volume 3, No. 3.** Ackermann, A.L. (ed.). EG and G Idaho, Inc., Idaho Falls, ID (USA). Mar 1989. 141p. Sponsored by U.S. DOE Energy Research. DOE Contract AC07-76ID01570. Order Number DE89016270/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

Highlights of the PBF/BNCT Program during March include: gross boron analysis in tissue blood and urine; analytical methodologies development for BSH (sodium borocaptate) purity determination; boron microscopic (subcellular) analytical development; noninvasive boron quantification determination; dosimetry; and analytical radiation transport and interaction modeling for BNCT.

46288 (EGG-BNCT–8353-Vol.3-No.4) **PBF/BNCT Program for cancer treatment: Bulletin.** Dorn, R.V. III; Ackermann, A.L. (ed.). EG and G Idaho, Inc., Idaho Falls, ID (USA). Apr 1989. 49p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE89016269/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Highlights of the PBF/BNCT Program during March include progress within the areas of: Gross Boron Analysis in Tissue Blood and Urine, Analytical Methodologies Development for BSH (Sodium Borocaptate) Purity Determination, Boron Microscopic (Subcellular) Analytical Development, Noninvasive Boron Quantification Determination, Dosimetry, Analytical Radiation Transport and Interaction Modeling for BNCT, Large Animal Model Studies, and Neutron Source and Facility Preparation.

46289 (EGG-FSP–8552) **Accident safety comparison of elements to define low activation materials.** Piet, S.J.; Cheng, E.T.; Porter, L.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). 20 Jul 1989. 209p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE89016210/JAW. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

This report quantifies what "low activation" means with regard to accident safety for naturally occurring elements from hydrogen through bismuth. The activation inventory from a neutron flux of 5 MW/m^2 for 4 years exposure at the first wall to a deuterium-tritium plasma was used for four figures of merit including: Prompt Dose Rating (PDR) based on the release fraction required to avoid any offsite acute radiation fatalities; Latent Dose Rating (LDR) based on the allowable release fraction to minimize offsite latent statistical cancers; Time Before Damage (TBD) based on the initial temperature rise rate from decay heat and the time available before damage (a 300° temperature rise); and Maximum Temperature Rise (MTR) based on the maximum temperature rise. The first two

figures of merit use the radioactive inventory and offsite dose calculations using the FUSCRAC3 computer code. The second two figures of merit are based on decay heat and simple generic blanket thermal models.

46290 (EUR–11608) **Health and safety in the nuclear age.** Commission of the European Communities, Luxembourg (Luxembourg). 1988. 267p. (CONF-8710473–: Seminar on third party financing for energy savings, 8-9 Oct 1987). Available from European Community Information Service 2100 M St., NW Suite 707 Washington, DC 20037.

In their Communication to the Council on the development of Community measures for the application of Chapter III of the Euratom Treaty - Health and safety (COM(86) 434 final) the Commission of the European Communities announced their intention to initiate a 'Standing Conference on Health and Safety in the Nuclear Age' in order to contribute to an increase of information on nuclear activities. Following this proposition, the Commission (Directorate-General for Employment, Social Affairs and Education, Health and Safety Directorate) organized the first meeting of this Standing Conference in Luxembourg on 5, 6 and 7 October 1987 with the theme 'Information for the public and the media on health protection and safety with regard to nuclear activities'. About 120 participants representing scientific experts, the media, the bodies concerned with environmental or consumer protection, the social partners and interested national and international organizations, took part in this conference. It was the first time at European Community level that a meeting allowed an exchange of positions on the health problems related to ionizing radiation by all the parties interested in this subject. The Commission was asked to pursue this dialogue in order to improve the perception of citizens of the Community of the potential risks and the methods of protection brought into force in the nuclear field.

46291 (EUR–11608, pp. 21-34) **Radiation all around us.** McAulay, I.R. (Trinity Coll., Dublin (IE)). Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8710489–: 1. meeting of the standing conference on health and safety in the nuclear age, 5-7 Oct 1987). In *Health and safety in the nuclear age.* Order Number DE89908200/JAW. Available from NTIS (US Sales Only), PC A12/MF A01.

Possible developments on radiation protection of the public within the European Community are evaluated. The greatest source of radiation exposure to the public arises from radon and its daughters. This exposure can be controlled and reduced by the application of special building techniques and remedial measures of the man made sources of exposure, medical radiation contributes the biggest share. Encouragement will be given to the more widespread use of techniques which can give the required information with a reduced dose. The other contributors to artificial sources of exposure are all relatively small. The dose to the public, from nuclear power and nuclear reprocessing, have been shown to be small and to be decreasing steadily. It is important, however, that continuing scientific studies be made on discharges of radioactivity to the environment and the resulting doses, both to ensure that desirable trends continue and to provide warning and information on incidents and accidents. Similar considerations should apply to other sources, such as fallout from weapons tests or the use of radioactivity in consumer goods.

46292 (EUR–11608, pp. 36-62) **Types and risks of radiation effects.** Jacobi, W. (Gesellschaft fuer Strahlen-und Umweltforschung m.b.H. Muenchen, Neuherberg (DE). Inst. fuer Strahlenschutz). Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8710489–: 1. meeting of the standing conference on health and safety in the nuclear age, 5-7 Oct 1987). In *Health and safety in the nuclear age.* Order Number DE89908200/JAW. Available from NTIS (US Sales Only), PC A12/MF A01.

In this paper the action of ionizing radiation on living organisms is shortly described and the resulting effects and risks are outlined. Main emphasis is given to the epidemiological findings on radiation-induced cancer and their consequences for the estimation of risks at low doses.

46293 (EUR–11608, pp. 63-80) **Quantitative assessment of risks resulting from exposure to radiation: problems of extrapolation and the choice of indicators.** Fagnani, F. (Centre d'Etude sur l'Evaluation de la Protection dans le domaine Nucleaire, 92 - Fontenay-aux-Roses (FR)). Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8710489–: 1. meeting of the standing conference on health and safety in the nuclear age, 5-7 Oct 1987). In *Health and safety in the nuclear age.* Order Number DE89908200/JAW. Available from NTIS (US Sales Only), PC A12/MF A01.

Some of the methodological problems involved in the quantitative estimate of the health detriment of ionizing radiations and in risk comparison are described. The limitations of the process of quantifying the risks resulting from exposure to low doses of radiation are both specific and non-specific. The results obtained, which are then used at international level, provide particularly reliable reference data on which there has been a surprisingly high level of agreement. The current revision of the dosimetry of Hiroshima and Nagasaki and the publication of the results of 30 years of follow-up carried out on the cohort against the background of the Chernobyl accident must not be misunderstood. These new aspects have revived the discussion on the risks of exposure to low doses and their acceptability to the public. However, it should be noted that recent scientific data have resulted in minor changes to previous estimates. The uncertainty is far lower than for other toxic and carcinogenic risks in the environment. It is probable that this increase in scientific knowledge is responsible for the well-known discussion and has caused an example to be made of this particular risk. In terms of science and institutions, this area of prevention is in some ways a model for the treatment of industrial hazards by society in the future.

46294 (INFO–0255) **Incidence of genetic disorders in children and young adults.** Anderson, T.W.; Baird, P.A.; Lowry, R.B.; Newcombe, H.B. Atomic Energy Control Board, Ottawa, ON (Canada). Nov 1987. 119p. Order Number DE89636327/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

Current estimates of the genetic risks from exposure to ionizing radiation are based on two kinds of data: (a) incidence rates in humans for the genetic diseases that are believed to be present in the population due to mutations of natural origin, and (b) radiation induced mutation rates. One necessary prerequisite before any possible increase in genetic load from mutagens can be estimated is baseline information on the magnitude of genetically-caused ill health already present in the population. The present study utilizes the data base of an ongoing population-based Registry with multiple sources of ascertainment to estimate the present population load from genetic disease. It was found that 4.9% of liveborn individuals below 25 can be expected to have genetic or partly genetic diseases. This was composed of single-gene disorders (autosomal dominant, autosomal recessive and X-linked recessive), chromosomal anomalies and multifactorial disorders (including those present at birth and those later in onset). Since previous studies have usually considered all congenital anomalies (ICD 740-759) as part of the genetic load, data are also presented separately for this category to facilitate comparison with earlier studies. These new data should represent a better estimate of the genetic load in the population than previous studies.

46295 (INIS-BR–1566) **Study of non-thermal effects from laser radiation on live tissues.** Cotta, M.A. Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica. Feb 1987. 97p. (In Portuguese). Order Number DE89636315/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

The functional biological effects related to the irradiation of live tissues with low power lasers, called non-thermal effects were theoretical and experimentally studied. For the experimental part, a device which allows to: irradiation lesions artificially created on the back of rats by a He-Ne laser, or put a moving ground glass in front of the laser beam, by irradiation of this same laser with its coherence degree decreased. The relevance of the radiation coherence in the lesion cicatrization process was shown. The electrical field distribution and the intensity distribution on a surface with microroughness when irradiated by coherent light are theoretically studied. (M.C.K.).

46296 (INIS-BR–1607) **Effects of ionizing radiation in crotamine from Crotalus durissus terrificus venous.** Costa, T.A. da. Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). 1988. 98p. (In Portuguese). Order Number DE89636302/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Ionizing radiations are sufficiently energetic and able to cleave any chemical bond. Molecules of substances present in solution have been shown either by direct or indirect action of ionizing radiations loss of biological activity. Crotamine obtained from C. d. terrificus venom by molecular exclusion cromatography was irradiated in aqueous solution of 1 mg/ml by gamma rays produced on a ^{60}Co source. Doses of 100 Gy, 2000 Gy and 5000 Gy (Dose rate = 1,14 x 10^3 Gy/h) in presence of O_2 were used for the comparison of properties of irradiated and non irradiated samples; the following assays were performed: determination of protein concentration, presence of free SH groups, SDS-Page and Ouchterlony's immunodiffusion. The Ellman's reaction for free SH groups was positive in the irradiated protein and negative one. The protein concentration was not altered up to the dose of 2000 Gy in relation to the native protein: at the dose of 5000 Gy was observed a loss of 55% of the proteic material. The SDS-PAGE analysis showed the formation of protein aggregates in the dose of 2000 Gy and 5000 Gy. A loss of the antigenic activity was observed both in the dose of 2000 Gy and 5000 Gy againt sera anticrotalic. Further studies was perfomed with crotamine irradiated at the dose of 2000 Gy in aqueous solution, O_2 absence and in presence of different concentrations of radioprotectors such as: cystein, sodium nitrate and tert-butanol. The level of the radioprotection to the toxin was estimated through the simple radical immunodiffusion technique. According to the technique the best radioprotective agent was cysteine. Since the antigenic determinants were preserved and in the SDS-PAGE analysis the crotamine structure was maintained entire like the non irradiated toxin. (author).

46297 (INIS-mf–11530) **Biochemical and microbiological quality of spices.** Sattar, A.; Mahmood, F.; Wahid, M.; Jan, M.; Khan, I. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jun 1988. 5p. Order Number DE89636313/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

NIFA annual report 1987-88.

The spoilage of spices is generally due to microbial contamination as well as development of off-favours due to oxidation of oils. This research was conducted to investigate the influence of irradiation doses (2-10 KGy) on bacterial and fungal contamination as well as col colour and volatile components during storage of spices. The influence of different gamma radiation doses on total mould count of spices such as turmeric, coriander, chilies, cumin and black pepper, was determined and the results are presented. The effect of irradiation on total bacterial counts of these spices is presented. The dose of 10 KGy decreased the bacterial counts to either undetectable or very low levels in various spices. (orig./A.B.).

46298 (INIS-mf–11531) **Effect of gamma irradiation on the physicochemical and cooking characteristics of chickpea.** Aurangzeb; Ahmad, M.; Bibi, N.; Badshah, A.; Khan, I. Nuclear Inst. for Food and Agriculture, Peshawar (Pakistan). Jun 1988. 9p. Order Number DE89636314/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

NIFA annual report 1987-88.

Gamma irradiation has long been know as a method of food preservation. Radiation treatment at moderate doses has been recommended for disinfestation of legumes. The treatment is shown to the effective for reduction of flatulence causing oligosaccharides and also of trypsin and chymotrypsin inhibitors. The nutritive quality of irradiated le is also enhanced. It has also been reported that short term feeding of irradiated diets to rats did not give any indication of mutagenic effects. (orig. /A.B.).

46299 (INIS-mf–11951) **Chernobyl - what can natural scientists or physicians say to that accident?. Brief lectures.** Stadt Mainz (Germany, F.R.); Mainz Univ. (Germany, F.R.). 1986. 45p. (In German). (CONF-8606429–: Joint discussion meeting of the Johannes Gutenberg University, the Max Planck Institute, and the local government of Mainz, 13 Jun 1986). Order Number DE89910834/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The public discussion meeting was intended to offer to the general public a platform for discussion of questions evoked by the Chernobyl reactor accident, and scientific information on what has happened there. The brief lectures therefore deal with the accident scenario as far as assessable at the time, and with the consequences to be expected for the Federal Republic of Germany, with the fallout situation in the Mainz area, and the atmospheric dispersion and transfer of air masses from Chernobyl to the FRG. The medical experts presented information on the radiation exposure of the population and the possible genetic risk. (DG).

46300 (INIS-SU–110/A, pp. 6-13) **^{67}Ga and ^{111}In buildup in neoplasms depending on chemical factors.** Sorokin, V.P.; Kozlova, M.D. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

^{67}Ga and ^{111}In with carrier and without it in the complex with 18 ligands of various molarity, with different pH values and additions were studied. The compound kinetics and excretion were examined in healthy rats and rats with inoculated tumours in the area of femur. The largest buildup of ^{67}Ga-citrate was observed with citrate concentration 1.01M and pH=6.0 in the tumor. The largest buildup of ^{3}In was noted in the tumor (1% per 1g, ratio neoplasm: muscle 700:1) in case of intravenous injection of ^{3}In without carrier in combination with lactate (0.1 M with pH=2) in the presence of EDTA (0.001 M). 3 refs.; 4 tabs.

46301 (INIS-SU–110/A, pp. 14-18) **Experimental study of fats and fatty acids labelled with I-131 in lung tissue.** Fadeev, N.P. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The carried out experiments enable to state that labelled fatty acids ^{131}I-OA (oleic acid in particular) are capable to be accunulated in the lungs in quantities sufficient for imaging. Optimal period for lung scintigraphy-24h following fatty acid intake. The information value of the method can be signifacantly increased by using short-lived and extremely short-lived radioisotopes such as ^{99m}Te and ^{2}C as a radioactive label. 3 refs.

46302 (INIS-SU–110/A, pp. 19-23) **Study of diagnostic information value of ^{57}Co-bleomycitin A_5 in animals with neoplasms of various strams.** Dedenkov, A.N.; Petriev, V.M.; Prusova, R.M. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The experimental data showed that nevly obtained tumorotropic ^{57}Co-BLM A_5 has very high diagnostic information value and can be used in imaging of neoplasms. The level of the preparation buildup doesn't depend on tumor histological structure. 2 refs.

46303 (INIS-SU–110/A, pp. 24-28) **Study of melanotropic properties of ^{125}I-chloroquine in the experiment.** Fadeev, N.P.; Savel'eva, O.P.; Rumyantseva, L.N.; Bobrova, V.N. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The carried out experiments showed that ^{125}I-chloroquine is of very high tropism in relation to melanoma tissue and the character of its kinetics in the organism of mice-tumorcarriers is quite favourable to reveal as a primary neoplasm and metastases in various lymph regions and lung, liver etc. It is advisable to use ^{131}I as a label of chloroquine for radioindication of melanoblastomas and particularly its metastases in man. 8 refs.

46304 (INIS-SU–110/A, pp. 29-36) **Proteolytic and inhibiting activity of blood of tumor-carriers.** Kulakov, V.N.; Dolgikh, M.S.; Bazhenova, T.L.; Korshunov, V.B. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection*

of scientific papers. Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Inhibition activity of blood considerably changes in the direction of decrease of free inhibitors in man and rabbits. That fact is explained by formation of free proteinases which bind part of inhibitors in case of carcinogenesis. The obtained data testify to the change of enzymeinhibitor ratio which is violated due to apperance of tumoral source. Radioenzymatic method of blood inhibition activity determination can be used in clinical picture as a diagnostic one and to control the efficiency of treatment measures as well. 12 refs.; 2 tabs.

46305 (INIS-SU–110/A, pp. 37-47) **Feasibilities of application of proteinases labelled with iodine radioactive isotopes, of their predecessors inhibitors and substrates in assessment of tumor effect on the organisms.** Sedov, V.V.; Sorokin, V.P.; Matveev, V.A.; Korshunov, V.B.; Pimenova, G.N.; Kulakov, V.N. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

A comparative study of the behaviour of proteinases labelled with iodine of proteinase predecessors, of inhibitors in intact animals and in animals with transplanted tumors was carried out. Data on the increase of the intensity of radioactive substance excretion with urine following injection of ephatine-^{125}I to animals with tumors (by 2 fold in relation to intact animals during 1 h) and on decrease of the radioactive substance buildup in gastro-intestinal tract are obtained. These processes are connected with the change of the given high molecular compound concentration induced by tumor growht. 6 refs.; 5 tabs.

46306 (INIS-SU–110/A, pp. 156-168) **Intra-arterial injection of radioactive microspheres in neoplasm treatment.** Sedov, V.V.; Volodin, I.A.; Tronova, I.N. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

A laboratory methods to obtain microspheres with ^{90}Y was developed. In the experiment on animals a possibility of the microspheres application for intraarterial injection for radiation treatment of highly vascularized neoplasms was shown. 25 refs.

46307 (INIS-SU–110/A, pp. 169-176) **Pharmacokinetics of cesium mercaptoundehydrododecaborate compound for neutron-capture therapy.** Spryshkova, R.A.; Brattsev, V.A.; Najdenov, M.G.; Shabalkin, I.P.; Serebryakov, N.G. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

It is stated that mercaptoundercahydrododecaborate actively joins dividing cells of neoplasm and is detanied by tumoural tissue at least for 48 h. Fast removal of mercaptoundecahydrododecaborate from neighbouring to tumour tissues and its retention in tumoural tissue enale (using repeated injection of the preparation into the organism) to create required for neutron capture therapy boron concentration gradient between tumoural and neighbouring normal tissues. 4 refs.; 2 tabs.

46308 (INIS-SU–110/A, pp. 182-186) **Experimental assessment of endolymphic therapy with radiopharmaceuticals.** Slobodyanik, I.I.; Mairt'yanov, B.M. Institut Biofiziki, Moscow (USSR). 1988. (In Russian). In *Radiopharmaceuticals in oncology. Collection of scientific papers.* Order Number DE89012209/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

An assessment of endolymphatic therapy efficiency using 2 new native preparations with ^{198}Au and ^{90}Y possessing roentgenocontrast properties was carried out. It was shown that endolymphatic irradiation of Brown-Pierce neoplasm with oil solutions containg ^{198}Au, ^{90}Y considerably decreases animals mortality. More pronounced treatment effect was observed in endolympliatic therapy with ^{90}Y oil solution. 1 tab.

46309 (LBL–27448) **The health risks of radon: The BEIR IV report and beyond.** Fabrikant, J.I. Lawrence Berkeley Lab., CA (USA). Jun 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8906195–1: Radon homes: dangerous or not?, 15 Jun 1989). Order Number DE89015335/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The National Academy of Sciences' BEIR IV Report deals with the health effects in human populations exposed to internally-deposited alpha-emitting radionuclides and their decay products. Quantitative risk estimates for cancer induction are derived, mainly from analyses of epidemiological data. The Report addresses the health outcomes of exposure to radon and its daughters, primarily lung cancer risks of worker exposure to radon progeny in underground mines and in the general public in indoor domestic environments. An excess relative risk model of lung cancer mortality and exposure to radon progeny is developed; this models the excess risk per Working Level Month in terms of time intervals prior to an attained age, and is dependent on time-since-exposure and age at risk. Risk projections are presented and cover exposure situations of current public health concern. For example, the lifetime risk of lung cancer mortality due to lifetime exposure to radon progeny in terms of WLM and alpha-particle dose to the target cells of the bronchial epithelium is estimated to be 350 excess deaths per million person-WLM. Lifetime exposure to 1 WLM y_{-1} is estimated to increase the number of deaths due to lung cancer by a factor of about 1.5 over the current rate for both males and females in a population having the current prevalence of cigarette-smoking. Occupational exposure to 4 WLM y_{-1} from ages 20 y to 40 y is projected to increase lung cancer deaths by a factor of 1.6 over the current rate of this age cohort in the general population. In all of these cases, most of the increased risk occurs to smokers for who the risk is up to ten times greater than for nonsmokers. 10 refs., 1 tab.

46310 (NRPB-GS–10) **Generalised derived limits for radioisotopes of ruthenium. Guidance on standards.** Robinson, C.A.; Haywood, S.M. National Radiological Protection Board, Chilton (UK). Jan 1989. 32p. Available from H.M. Stationery Office, London, price Pound 5.00.

Generalised derived limits (GDLs) are presented for the radiologically significant isotopes of the element ruthenium, ruthenium-103 and ruthenium-106. These GDLs are derived from an annual effective dose equivalent limit of 1 mSv. The GDLs are intended for use as convenient reference levels against which the results of environmental monitoring can be compared and atmospheric discharges assessed. Generalised derived limits are calculated for uniform conditions over a year and use deliberately cautious assumptions concerning the habits and location of the critical group of exposed individuals in the population and, where appropriate, concerning the conditions of discharge and the prevailing weather conditions. If the environmental contamination over a year or discharge to the atmosphere exceeds about 25% of the GDL, critical-group doses should be examined more closely, taking account of site-specific factors and the duration of the period of excess. For ruthenium-103 the most important exposure pathway, from discharges to the atmosphere, is external irradiation from deposited activity. This pathway is also an important contributor to dose for ruthenium-106, but in this case the dominant pathway is the inhalation of activity from the cloud. (Author).

46311 (ORAU–88/F-111) **A compendium of major US radiation protection standards and guides: Legal and technical facts.** Mills, W.A.; Flack, D.S.; Arsenault, F.J.; Conti, E.F. Oak Ridge Associated Universities, Inc., TN (USA); Social, Educational Research and Development, Inc. (USA). c Jul 1988. 141p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-76OR00033. Available from Oak Ridge Associated Univ., Office of Information Services, P.O. Box 117, Oak Ridge, TN 37831-0117.

Following discussion of the general issue, the CIRRPC Executive Committee approved, with concurrence of the full Committee, an Oak Ridge Associated Universities (ORAU) staff proposal to develop a compendium of Fact Sheets on the major US radiation protection standards and guides, existing or proposed. The compendium contains relevant legal or statutory information and detailed technical requirements that state and describe the protection to be achieved. The report provides appropriate legislative citations; notes any

legislative language that gave direction to the development of standards promulgated under the legislation; cites rationales for the standards promulgated; and provides a listing of related standards. Two consultants with considerable experience in radiation protection regulations were contracted to assist the ORAU staff in developing the report. This report has been reviewed twice by the CIRRPC member agencies; once to ensure the accuracy of all the legal and technical facts in the compendium, and once to comment on the entire document, including the accompanying text. This final report reflects consideration of all the agencies' comments received during the reviews. Part I of this report presents information on the selection, preparation and content of the Fact Sheets; an overview of their scopes, applications and modes of control; and the ORAU conclusions and recommendations. Part II contains the Fact Sheets and a User's Guide to finding relevant information in the Fact Sheets.

46312 (ORNL/TM–10971, pp. 1-9) **Radiation protection in the hospital environment.** Vetter, R.J. Oak Ridge National Lab., TN (USA). Nov 1988. (CONF-881032–: 2. conference on radiation protection and dosimetry, 31 Oct - 3 nov 1988). In *Proceedings of the second conference on radiation protection and dosimetry.* Order Number DE89001663/JAW. Available from NTIS, PC A11/MF A01.

The hospital environment contains numerous sources of ionizing radiation that may contribute to public and occupational radiation exposure. Radiation exposure from x rays is minimized through engineering design, administrative controls, and quality control. Exposure from patients that contain therapeutic quantities is minimized by isolation in appropriately controlled private rooms. Administrative controls are relied on for controlling radiation exposure from diagnostic nuclear medicine patients. Hospital radiation installations must be planned and periodically reviewed to take advantage of the latest developments in radiation protection and to keep public and occupational exposure as low as reasonably achievable.

46313 (PNL–6450-21-HEDR) **Hanford Environmental Dose Reconstruction Project: Monthly report.** Dennis, B.S. (comp.). Pacific Northwest Lab., Richland, WA (USA). Jul 1989. 44p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE89016242/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This summary covers progress for the month of July 1989 during which we completed the scheduled milestone 0504-B, Measured River Fish Concentrations; presented a project status update at the TSP meeting on July 21 in Richland, WA; presented the potential role of iodine-129 in the HEDR Project at the TSP meeting; displayed posters at the TSP meeting summarizing available information for the Columbia River between Priest Rapids Dam and McNary Dam; held a working session on the dose calculational model with PNL staff, TSP members, and three members of the public; presented an overview of the HEDR Project's Quality Assurance (QA) program to six members of the TSP; continued internal PNL clearance on several draft reports, which will become part of the Phase I summary report; completed entry of meteorological data for 1983 through 1987 into the meteorological data base; completed verification of the modified MESOILT code; completed preliminary reviews of the analytical methods used as the basis for determining potential biases and the level of uncertainty for two milestones, 0504-B, Measured River Fish Concentrations and 0503-B, Final River and Sediment Monitoring Data; and completed the creation and verification of data files on radionuclide concentrations in vegetation through August 1946.

46314 (PNL–6500-Pt.4, pp. 33-35) **Microdosimetry of fast heavy ion beams.** Metting, N.F.; Braby, L.A.; Toburen, L.H.; Kraft, G.; Scholz, M.; Kraske, F.; Schmidt-Boecking, H.; Doerner, R.; Seip, R. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

Biophysical and biochemical studies of the effects of high-LET radiation under way at numerous laboratories indicate the importance of understanding the pattern of energy deposition in volumes comparable to that of subcellular structures. The inadequacy of LET as a quantitative description of radiation quality has been shown in numerous experiments employing heavy charged particles. In order to better understand the molecular mechanisms responsible for the biological effects of high-LET radiation, it is important to obtain more detailed information regarding the stochastic nature of energy deposition in volumes of subcellular dimensions. During the past year we have completed a study of the distributions of ionization as a function of the radial distance from high-energy iron ions in collaboration with scientists from Lawrence Berkeley Laboratory (LBL) and Columbia University and initiated new studies at the UNILAC accelerator at GSI-Darmstadt, West Germany.

46315 (UCID–21672) **Work plan radiological assessment of the Laboratory for Energy-Related Health Research.** Layton, D.W.; Noshkin, V.E. Lawrence Livermore National Lab., CA (USA). May 1988. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. Order Number DE89015616/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Laboratory for Energy Related Health Research (LEHR) is a facility owned by the US Department of Energy (DOE) and operated by the University of California (UC). The LEHR facilities are located on UC-owned lands south of the main campus of UC Davis. A number of DOE-funded laboratory studies involving different radionuclides have been conducted at LEHR since 1959. Two major projects were long-term toxicity studies with beagles administered ^{90}Sr and ^{226}Ra. In recent years DOE funded research has declined, and the DOE has decided to transfer the buildings at LEHR to UC. Property-transfer actions involving federally-owned facilities that may have residual contamination with radioactive substances must undergo a formal certification process. A key component of the certification process is a radiological survey to determine the nature and extent of any residual contamination. Areas with radioactivity above acceptable levels are decontaminated and then monitored for compliance. Normally, the decommissioning goal is to allow unrestricted uses of facilities, however, in some instances restrictions may be placed on uses if complete decontamination is infeasible or prohibitively expensive. All actions and supporting documentation regarding the transfer of contaminated facilities are contained in an official certification document. The purpose of this document is to describe the sampling and analysis protocols that will be used to carry out the radiological survey of the LEHR facilities. 5 refs., 1 fig., 1 tab.

46316 (WHC-SA–0484) **A practical method of performing cost-benefit analysis of occupational and environmental protective measures.** Boothe, G.F.; Webb, D.E. Westinghouse Hanford Co., Richland, WA (USA). Mar 1989. 12p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-87RL10930. (CONF-890935–1: International workshop on new developments in occupational dose control and ALARA implementation at nuclear power plants and similar facilities, 18-21 Sep 1989). Order Number DE89008795/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A practical method of performing cost-benefit analysis for radiation protective measures relative to specific jobs or projects has been developed. The method is applicable to protective measures for both occupational and public radiation exposures. The method provides a straightforward, consistent procedure for weighing the cost and impact of protective measures against the benefits derived. The procedure employs various decision gates based on person-rem dollar figures and an ALARA factor analysis that weighs nonquantitative parameters. The procedure is designed to be used by job planners, design engineers, or other personnel, with appropriate consultation by qualified health physicists. 2 figs.

46317 **Reminiscences of a mouse specific-locus test addict.** Russell, W.L. (Oak Ridge National Lab., TN (USA)). *Environmental and Molecular Mutagenesis (USA),* : 16-22 (1989).

This paper describes some of the historical events surrounding the development of and achievements with the mouse specific-locus test in radiation and chemical mutagenesis. Some ongoing and future contributions of the test to research in molecular genetics are also mentioned.

46318 **Chelation of ^{238}Pu(IV) in vivo by 3,4,3-LICAM(C): Effects of ligand methylation and pH.** Durbin, P.W. (Lawrence

Berkeley Lab., CA (USA)); White, D.L.; Jeung, N.L.; Weitl, F.L.; Uhlir, L.C.; Jones, E.S.; Bruenger, F.W.; Raymond, K.N. *Health Physics (USA)*, 56(6): 839-855 (Jun 1989).

The linear tetracarboxycatecholate ligand, 3,4,3-LICAM(C) N1,N5,N10,N14-tetrakis(2,3-dihydroxy-4-carboxybenzoyl-tetraaza tetradecane, tetra sodium salt) injected within 1 h after injection of Pu(IV) citrate, removes about the same fraction of Pu from animals as CaNa3-DTPA but removes less inhaled Pu than CaNa3-DTPA and leaves a Pu residue in the renal cortex. However, the formation constant of the expected Pu-3,4,3-LICAM(C) complexes are orders of magnitude greater than that of Pu-DTPA, and 3,4,3-LICAM(C) is 100 times more efficient than CaNa3-DTPA for removing Pu from transferrin in vitro. Because the formation constants of their actinide complexes are central to in vivo actinide chelation, ligand design strategies are dominated by the search for ligands with large Pu complex stabilities, and it was necessary to explain the failure of 3,4,3-LICAM(C) to achieve its thermodynamic potential in vivo. All the batches of 3,4,3-LICAM(C) prepared at Berkeley or in France [Euro-LICAM(C)] were found by high-pressure liquid chromatography to be mixtures of the pure ligand [55% in Berkeley preparations, 8.5% in Euro-LICAM(C)] and its four methylesters. A revised synthesis for 3,4,3-LICAM(C) is appended to this report. All of the incompletely hydrolyzed 3,4,3-LICAM(C) preparations and the pure ligand were tested for removal of Pu from mice [238Pu(IV) citrate intravenous, 30 mumol kg-1 of ligand at 1 h, kill at 24 h, radioanalyze tissues and separated excreta]. The presence of methylesters did not significantly impair the ability of the ligands to remove Pu from mice, and it did not alter the fraction of injected Pu deposited in kidneys. Temporary elevation (reduction) of plasma and urine pH of mice by 0.5 mL of 0.1 M NaHCO3 (NH4Cl) injected before or simultaneously with pure 3,4,3-LICAM(C) somewhat improved (significantly reduced) Pu excretion but had little influence on Pu deposition in kidneys.

46319 (ACOH/SD–1988) **Report on H_2S toxicity.** Alberta Community and Occupational Health, Edmonton, AB (Canada). Occupational Health and Safety Div. 1988. 75p. (MICROLOG–89-02221). Available from Alberta Health, 10030-107 St., 8th Floor, Seventh Street Plaza, Edmonton, AB, CAN T5J 3E4; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

An Alberta governmental committee was established to document and evaluate the known health effects of short-term exposures to hydrogen sulfide gas. Scientific evidence was reviewed for low level acute, subacute and chronic effects in the 0-100 ppM range, especially at the low end of that range, and to clarify the issue of the effects of low levels of hydrogen sulfide on sensitive individuals. Based on analysis of the literature, it seems clear that certain individuals may be more susceptible to the effect of hydrogen sulfide than others. Other factors may in part account for such hypersusceptibility, such as mixed exposure with other chemicals at the same time, pre-exposure to medications, and pre-existing and/or current diseases or medical conditions. Hydrogen sulfide by itself is a broad spectrum toxicant that can elicit numerous psychological and biological responses in the 0-20 ppM range. All organ systems respond variably to different hydrogen sulfide levels, with no level affecting all systems equally at the same time or rate. In general, single or repeated exposures of normal, healthy adults to hydrogen sulfide concentrations in the 0-5 ppM range have not resulted in clinically detectable irreversible biological or psychological effects. Although reversible adverse effects may result in temporary discomfort or changes in organ function, they have not been found to have a lasting impact to date. There remains a lack of good scientific data about the long term, low level chronic effects of hydrogen sulfide on community populations, hypersusceptible individuals, and workers in sour gas operations. 97 refs., 2 figs., 21 tabs.

46320 (AD-A–207987/9/XAB) **Army occupational health and AEJA (Army Environmental Hygiene Agency).** Kneessy, A.D. Army Environmental Hygiene Agency, Aberdeen Proving Ground, MD (USA). May 1981. 10p. Available from NTIS, PC A02/MF A01.

The Army Environmental Hygiene Agency (AEHA) recently celebrated 38 years of continuous service in support of occupational health programs of the Army. This report briefly reviews its historical development, examine some of its current occupational and industrial hygiene programs, and touches on future program efforts. The Army Industrial Hygiene Laboratory, conducts surveys and investigations concerning occupational health hazards in Army-owned and operated industrial plants, arsenals and depots, and privately owned and operated ordnance explosive establishments. The end of World War II was the beginning of the nuclear age and attendant Medical Department responsibilities for radiation protection programs beyond the traditional concern for x-ray protection. The US Army has undertaken the demilitarization of obsolete and excess chemical munitions. The Medical Systems Safety and Health Branch is tasked to survey Army hospitals within the United States, to identify and recommend corrective action for safety and health hazards. At present, a continuing study is underway to evaluate the waste anesthetic gases to operating room personnel in Army hospitals. Noise-induced hearing loss is considered the most widespread occupational injury incurred by DA personnel.

46321 (AD-A–208175/0/XAB) **Upper bound on the-threshold crossing probability for short-time exposure dosage with implications for the assessment of hazard from toxic vapors. Memorandum report.** Yee, E.C. Defence Research Establishment Suffield, Ralston, AB (Canada). Mar 1989. 34p. (DRES-SM–1260). Available from NTIS, PC A03/MF A01.

The effects of most toxic substances (e.g., chemical and biological warfare agents) are cumulative in the sense that the response of the biological receptor (e.g., human lung) is dependent on the concentration of the noxious vapor integrated over the total exposure time, i.e., the total exposure dosage. An upper bound on the threshold-crossing probability of the random dosage field produced by the instantaneous or short-term release of a passive scalar (contaminant) into the turbulent atmospheric boundary layer is obtained. This bound is constructed by developing a model for the nonstationary stochastic process representing the fluctuations in the concentration of the contaminant as observed at some fixed receptor downwind of the source (i.e., the point of release of the scalar). The implications of this bound for the evaluation of the hazard posed by the release of toxic substances into the atmosphere is discussed. Here, it is emphasized that the neglect of fluctuations in the dosage can lead to significant underestimation of the risk of exposure to the toxic substance. Furthermore, it is speculated that the nature as well as the magnitude of the concentration fluctuations will have considerable impact on the protection levels that are provided by the current individual and collective protection equipment such as mask cannisters or filters and protective suits.

46322 (AD-A–208195/8/XAB) **Inhalation toxicology. 9. Times-to-incapacitation for rats exposed to carbon monoxide alone, to hydrogen cyanide along, and to mixtures of carbon monoxide and hydrogen cyanide. Technical report, January-November 1986.** Crane, C.R.; Sanders, D.C.; Endecott, B.R. Federal Aviation Administration, Washington, DC (USA). Office of Aviation Medicine. Jan 1989. 27p. (DOT/FAA/AM–89/4). Available from NTIS, PC A03/MF A01.

Laboratory rats were exposed to experimental atmospheres that contained (a) carbon monoxide in air, (b) hydrogen cyanide in air, and (c) mixtures of CO and HCN in air. The toxic potency of each of the three types of environments was evaluated toxico-kinetically be measurement of time-to-incapacitation as a function of toxic gas concentrations. Regression equations were derived that describe those relationships for exposure to CO or HCN alone. Analysis of the data from the combined-gas exposures, and comparison of that data with the results obtained from the exposures to each gas alone, lead to the conclusion that the toxicity of the combination is definitely greater than would be produced by either gas alone. There was, however, no evidence for a synergistic action–in which the effect of the combination would have been greater than that predicted from the sum of the two individual effects. An empirical

equation was derived that allows calculation of a predicted time-to-incapacitation for any combination of CO and HCN concentrations that are within the ranges utilized in the experimental exposures.

46323 (CONF-8908118–1) **Zooplankton population dynamics in experimentally toxified pond ecosystems.** Sierszen, M.E.; Boston, H.L.; Horn, M.J. Oak Ridge National Lab., TN (USA). 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 24. congress of the International Association of Theoretical and Applied Limnology; 13-19 Aug 1989. Order Number DE89016291/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

To evaluate ecosystem response to and recovery from toxic contamination, we added phenolic compounds to a series of experimental ponds. Toxicants were added repeatedly in a temporally staggered sequence to evaluate the influence of seasonal factors and previous exposure history on the responses to toxicant stress. We hypothesized that seasonal changes in ecosystem structure, e.g. shifts in the relative importance of "top-down" and "bottom-up" controls on energy flow, would influence the system-level responses to the toxicant. Information from these experiments is being incorporated into models that predict ecological risk and system-level behavior under toxicant stress. Here we focus on the responses of zooplankton populations to toxicants, and factors which may affect the apparent severity of toxic effects. 9 refs., 4 figs.

46324 (DLG–538031) **The inhibiting effect of calcium at higher pollutant burdens.** Schenkel, H. Deutsche Landwirtschafts-Gesellschaft e.V., Frankfurt am Main (Germany, F.R.). 1988. 50p. (In German). (CONF-8801168–1: DLG winter meeting, 12-13 Jan 1988). Order Number DE89910932/JAW. Available from NTIS (US Sales Only), PC A03/MF A01; NTIS (US Sales Only), PC A03/MF A01.

A brief survey on the influence of lead and cadmium on calcium metabolism, is followed by an illustration of the significance of a marginal calcium supply for the metabolism behaviour and the toxicity of the two heavy metals. Subsequently, on the basis of different bibliographical data, the paper discusses the possible protective effect of a calcium supplementation exceeding the demand in the case of a lead and/or cadmium exposure as well as the problem of the application of existing findings from animal experiments for practical hints for feeding. (orig./MG).

46325 (ETDE-mf–9914883) **Studies of the genetic alteration of forest trees due to acid precipitations. Short report.** Geburek, T.; Scholz, F. Bundesforschungsanstalt fuer Forst- und Holzwirtschaft, Grosshansdorf (Germany, F.R.). Inst. fuer Forstgenetik und Forstpflanzenzuechtung; Umweltbundesamt, Berlin (Germany, F.R.). [1986]. 12p. (In German). Contract UFOPLAN-Nr. 10607046/02. Order Number DE89914883/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Air pollution can change soil conditions, and cause selection in forest tree populations. To simulate the effects of toxic soil conditions a hydroculture system was developed and applied, by which quantification of selection effects is possible in Norway spruce (Picea abies). As toxic component aluminum was applicated in different molaric Ca/Al-rations. Subsets of plants showed a remarable individual variation in Al-sensitivity. Selection was traceable by the use of related plant material. Strong association between genetic parameters by isoenzyme analysis and Al-sensitivity were not always found. However, comparisons between genotypic and genic structures of seed-parents with sensitive and tolerant offspring respectively showed significant differences. The results let expect Al-induced selection on the genic level. Such selection can reduce the genetic multiplicity and can lessen the adaptability of forest tree populations to multiple natural and anthropogenous environmental conditions. (orig.).

46326 (ORNL/FTR–3344) **[Genetic toxicology in developing countries, Guadalajara, Mexico, July 19–24, 1989]: Foreign trip report.** Travis, C.C. Oak Ridge National Lab., TN (USA). 4 Aug 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89016271/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended an International Conference on Genetic Toxicology in Developing Countries in Guadalajara, Mexico. The objective of the conference was to provide technical knowledge in the area of environmental toxicology to participants from the 23 developing countries represented. Conference participants identified the following top priorities to aid in the application of environmental toxicology principles in developing countries: (1) increased joint research activities in all aspects of science, (2) an increased number of training courses held in developing countries to facilitate exchange of experience and techniques, and (3) access to data bases in toxicological properties of chemicals.

46327 (PB–89-183057/XAB) **Studies on air pollution: Effects of nitrogen dioxide on airway caliber and reactivity in asthmatic subjects; effects of nitrogen dioxide on lung lymphocytes and macrophage products in healthy subjects; nasal and bronchial effects of sulfur dioxide in asthmatic subjects. Final report, 26 June 1987-26 November 1988.** Boushey, H.A.; Rubinstein, I.; Bigby, B.G. California Univ., San Francisco, CA (USA). Cardiovascular Research Inst. 13 Dec 1988. 53p. Available from NTIS, PC A04/MF A01.

The investigators performed three studies of the effects of NO_2 and SO_2 on airway function in human subjects. In 9 exercising asthmatic subjects, a 30-min exposure to 0.3 ppm nitrogen dioxide did not alter specific airway resistance, maximal expiratory flow, or the slope of phase III on the single breath test of nitrogen distribution and had no effect on airway hyperresponsiveness to sulfur dioxide. In the second study, repeated exposure of 5 healthy subjects to nitrogen dioxide was associated neither with any significant change in pulmonary function nor in the levels of secretory product of lung macrophages in bronchoalveolar lavage fluid. Analysis of the numbers and types of lymphocytes in venous blood and bronchoalveolar lavage fluid revealed no change apart from a small, possibly artifactual increase in natural killer cells in bronchoalveolar lavage fluid after NO_2 exposure. The third study examined whether brief exposures to moderately high concentrations of SO_2 caused acute increases in nasal symptoms and nasal resistance in 8 subjects with a history of both asthma and allergic rhinitis and with demonstrable bronchial hyperreactivity to SO_2.

46328 (PB–89-189773/XAB) **Effects of heavy metals in sediments on the macroinvertebrate community in the Short Creek/Empire Lake aquatic system, Cherokee County, Kansas: A recommendation for site-specific criteria. Technical report (Final).** Jobe, J. Kansas State Biological Survey, Lawrence, KS (USA). Oct 1988. 52p. Available from NTIS, PC A04/MF A01.

This study uses statistical analysis techniques to determine the effects of four heavy metals (cadmium, lead, manganese, and zinc) on the macroinvertebrate community using the data collected in the fall 1987. The concentrations of all four metals were found to be greatly elevated throughout Empire Lake and in both the Spring River and Shoal Creek arms of the reservoir. It is concluded that density and species richness were greatly reduced. The report also includes recommendations for the upper bounds for the sediment criteria of the four metals.

46329 (PB–89-200240/XAB) **Health-risk assessment of chemical contamination in Puget Sound seafood. Final report 1985-1988.** Williams, L. Tetra Tech, Inc., Bellevue, WA (USA). Sep 1988. 375p. (TETRAT-TC–3338-28). Available from NTIS, PC A16/MF A01.

This report provides resource management and health agencies with a general indication of the magnitude of potential human health risks associated with consumption of recreationally harvested seafoods from Puget Sound. Data collection and evaluation focused on a variety of metal and organic contaminants in fish, shellfish and edible seaweeds from 22 locations in the Sound. EPA risk assessment techniques were used to characterize risks to average and high consumer groups for both carcinogens and noncarcinogens. Theoretical risks associated with consumption of both average and high quantities of Puget Sound seafood appear to be comparable to or substantially less than those for fish and shellfish from other locations in the United States.

46330 (PB–89-201875/XAB) **Pentachlorophenol: health and environmental effects profile.** Choudhury, H.; Coleman, J.; De

Rosa, C.T.; Stara, J.F. Environmental Protection Agency, Cincinnati, OH (USA). Office of Environmental Criteria and Assessment. 1986. 91p. (EPA–600/J-86/503). Available from NTIS, PC A05/MF A01.

Pub. in Toxicology and Industrial Health, Vol. 2, No. 4, 483-571(1986). See also PB–89-124473.

Pentachlorophenol is used as an industrial wood preservative for utility poles, crossarms, fence posts, and other purposes (79%); for NaPCP (12%); and miscellaneous including mill uses, consumer wood preserving formulations and herbicide intermediate (9%). Photolysis and microbial degradation are the important chemical removal mechanisms for pentachlorophenol (PCP) in water. Direct photolysis may be an important environmental sink for PCP present in the atmosphere. Soil-degradation studies indicate the PCP is biodegradable; microbial decomposition is an important and potentially dominant removal mechanism in soil. Monitoring studies have confirmed the widespread occurrence of PCP in surface waters, groundwater, drinking water and industrial effluents. Subchronic and chronic toxicity studies show adverse effects in the liver, kidney and immune system. Inadequate evidence exists for carcinogenicity.

46331 (PB–89-866040/XAB) **Toxic substances: Effects on fish. January 1978-July 1989 (Citations from Pollution Abstracts). Report for January 1978-July 1989.** National Technical Information Service, Springfield, VA (USA). Jul 1989. 154p. Available from NTISPC N01/MF N01.

Supersedes PB–88-867056.

This bibliography contains citations concerning the biochemical and physiological effects of toxic substances on fish populations. Particular emphasis is placed on using fish as an indicator of pollution in aquatic ecosystems. Toxicity effects of mercury, zinc, calcium chloride, sodium chloride, lead, cadmium, copper, and aluminum in freshwater and seawater fish are included. (This updated bibliography contains 330 citations, 66 of which are new entries to the previous edition.)

46332 (UCRL–100511) **Managing human exposure and health risks: An integrated approach and the role of uncertainty.** McKone, T.E. Lawrence Livermore National Lab., CA (USA). Mar 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890909–1: 8. world clean air congress and exhibition, 11-15 Sep 1989). Order Number DE89008611/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Human populations contact environmental pollutants through food,water, and air in varying amounts each day throughout a lifetime. A realistic strategy for managing health risks of environmental contaminants therefore requires a comprehensive and integrated approach. Using examples for exposure to contaminants in potable water and to contaminants transferred from air to food, this paper considers two important issues in exposure assessment – the completeness of current exposure models and the treatment of uncertainty in exposure estimates. The results indicate that risk managers should consider the potential for multiple pathways, avoid risk assessments derived from single value estimates, be aware of the uncertainty in risk estimates, and include this awareness in their decisions.

46333 Effects of sulfur dioxide or ammonium sulfate exposure, alone or combined, for 4 or 8 months on normal and elastase-impaired rats. Smith, L.G. (Pacific Northwest Laboratory, Richland, WA (USA)); Busch, R.H.; Buschbom, R.L.; Cannon, W.C.; Loscutoff, S.M.; Morris, J.E. *Environmental Research (USA)*, 49(1): 60-78 (Jun 1989).

Normal and lung-impaired rats were compared after exposure to SO2 and/or (NH4)2SO4 for 4 or 8 months, or for 8 months plus 3 months recovery. Young adult male Sprague-Dawley rats were pretreated intratracheally with either physiologic saline (normal lungs) or porcine pancreatic elastase (impaired lungs). Rats from each pretreatment group were exposed to filtered air (control), to SO2 (1 ppm) or (NH4)2SO4 (0.5 mg/m3), or to combined SO2 + (NH4)2SO4 for 5 hr/day, 5 days/week. Morphologic, physiologic, and immunologic criteria were evaluated. At 4 months cellular immunologic responsiveness was not impaired, but physiologic changes were detected. Morphologic changes were apparent in all time periods. Elastase-induced changes included greater lung volumes, emphysema, and alveolar interstitial fibrosis. Pollutant effects included bronchiolar epithelial hyperplasia and changes in alveolar mean chord length (MCL). Relative to controls, bronchiolar epithelial hyperplasia and MCL increased in saline/pollutant groups, but decreased in elastase/pollutant rats at 4 months. The pretreatment/pollutant interaction was not observed at 8 months. Elastase effects persisted throughout the recovery period. Pollutant effects were more transitory, although alveolar septal fibrosis was greater in saline/(NH4)2SO4 rats at 8 months. Pulmonary function changes associated with elastase included increases in residual volume, functional residual capacity, and the residual volume/total lung capacity ratios. The alveolar plateau of single-breath washout (N2 slope) was significantly steeper in elastase-treated rats but less steep in animals exposed to SO2 or to (NH4)2SO4 than in those exposed to air only.

46334 Origins of genetic toxicology and the Environmental Mutagen Society. Wassom, J.S. (Oak Ridge National Lab., TN (USA)). *Environmental and Molecular Mutagenesis (USA)*, : 1-6 (1989).

A brief history of events that contributed to the establishment of genetic toxicology as a distinct research area and influenced the formation of the Environmental Mutagen Society is presented.

46335 Reciprocal relationship between mouse germ-cell mutagenesis and basic genetics: From early beginnings to future opportunities. Russell, L.B. (Oak Ridge National Lab., TN (USA)). *Environmental and Molecular Mutagenesis (USA)*, : 23-29 (1989).

The scientific foundations for several mammalian germ-line mutagenesis tests in common use today were laid in the 1930s, 1940s, and early 1950s. Subsequent developments in the field have had multiple objectives: detection of mutagenicity of environmental agents (which has led to the development of numerous methodologies), identification of biological and physical factors that affect mutation yield, analysis of the structural nature of the genetic alterations, and assessment of the organismic effects of various types of mutations. Mutagenesis studies have made numerous contributions to basic genetics by generating mutant types that led to elucidation of sex-determining mechanisms in mammals; formulation of the single-active-, or inactive-, X-chromosome hypothesis; correlation of genetic and cytological maps; discovery of genetic "imprinting" phenomena; study of developmental pathways and cell lineages, etc. Particularly useful are sets of complexly overlapping deletions that have been recovered in radiation mutagenesis studies, propagated in breeding stocks, and genetically analyzed; these have constituted prerequisites for molecular genetic studies aimed at development of the DNA structure-function relationships for important genomic regions. Mutagenesis experiments have also served to identify mutagens that are particularly effective in inducing specific types of genetic lesions desired for basic studies. Reciprocally, basic genetics has contributed to the development of mutagenesis tests and has enhanced the value of the specific-locus test by adding to its quantitative capabilities the capability for qualitatively characterizing the actions of mutagens.

46336 (AD-A–207747/7/XAB) **Preliminary model of the distribution of laser-induced retinal lesions resulting from eye and head responses. Interim report, Julu 1987-January 1988.** Kosnik, W.D. Krug International, San Antonio, TX (USA). Technology Services Div. Nov 1988. 27p. Available from NTIS, PC A03/MF A01.

A computer program was developed to simulate a pilot's reaction to an ocular exposure from a multiple-pulse laser. The simulation outlines five different scenarios of eye and head responses that are likely to occur in response to a laser exposure. These responses are: (1) closing the eyes; (2) centering the laser image on the fovea with a saccadic eye movement; (3) executing a saccade to avoid foveating the laser beam; (4) holding the eyes stationary relative to the laser beam; and (5) tracking a moving object during the laser exposure. The simulation modeled the effects of a 1-s laser exposure with pulse rates of 5,15, or 30 pulses/s and beam angles of 0, 10, 20, or 30 deg eccentric from the point of fixation. The output of the simulation predicted the number and distribution of lesions in

terms of retinal topography and acuity under the aformentioned conditions. The results of the simulation demonstrated that the pilot's reactions significantly influenced the number and pattern of lesions deposited on the retina. The most serious threat to vision resulted from an eye improvement that foveated the laser. Eye movements that diverted the laser from the fovea appeared to minimize the impact on vision. However, further work will be needed to quantify the size and location of athe visual field loss.

46337 (AD-A–207945/7/XAB) **Transient visual effects of prolonged small spot foveal laser exposure. Report for January-March 1989.** Zwick, H.; Robins, D.O.; Magsood, N. Letterman Army Inst. of Research, San Francisco, CA (USA). Mar 1989. 19p. (LAIR–373). Available from NTIS, PC A03/MF A01.

In recent experiments, the authors evaluated the effects of acute, threshold damage levels of small-spot foveal laser exposure. These experiments revealed transient changes in acuity and contrast sensitivity lasting from 10 to 15 minutes postexposure. Following recovery from such effects, normal acuity and contrast sensitivity are not necessarily degraded, although continuous exposure at these levels does result in parafoveal compensation for foveal damage and eventual deficit in fine visual acuity. Development of a test of foveal function during and after small-spot foveal exposure was the primary objective of this investigation. This objective was accomplished. At retinal damage levels, only a small focal foveal lesion was observed indicating the ability to utilize the fovea during such exposure. Post-exposure recovery effects analyzed for target size and contrast conditions suggest retinal and possibly cortical saturation processes.

46338 (DOE/RA/50219–T9) **[Study of the behavioral and biological effects of high intensity 60 Hz electric fields]: Quarterly technical progress report No. 29.** Orr, J.L. Southwest Research Inst., San Antonio, TX (USA). 14 Jul 1989. 141p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC02-80RA50219. (SWRI–12-6253). Order Number DE89015528/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

Activities this quarter involved all phases of the project plus a meeting of the Joint Committee in Tokyo. Detailed mapping of the exposure facility is scheduled to be completed during the week of August 14, 1989. Both electric and magnetic fields should be available for tests of the components of the tether and blood sampling system for the neuroendocrine pilot study in September 1989. The groups for the social behavior study are stabilizing appropriately. Details on the formation of the groups and their status has been provided. Dr. Coelho has included information related to aspects of the social experiment ranging from age estimation in baboons through the cardiovascular consequences of psychosocial stress. In addition, a draft manuscript is included on the data from the previous experiments which describes the effects of 30 and 60 kV/m electric fields on the social behavior of baboons. Tests of the blood handling procedures and analysis methods have been completed. With the exception of the catecholamine analyses, the handling procedures and variability in replicate measurements are satisfactory. Logistic and practical considerations now weigh strongly against including the analysis of the blood samples for catecholamines. Preliminary tests indicate that a sampling procedure which will work for the other compounds is probably not satisfactory for the catecholamines.

46339 (OH/RD–88-121-K) **Guidelines for residential source characterization program.** Harvey, S.M. Ontario Hydro Research Div., Toronto, ON (Canada). 1988. 7p. (MICROLOG–89-02600). Available from Ontario Hydro Research Division, Records Clerk, Bldg. KR 107, 800 Kipling Ave., Etobicoke, ON, CAN M8Z 5S4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Two epidemoilogical studies carried out in the Denver area have raised the hypothesis that increased levels of power-frequency magnetic fields in residences may be associated with increased incidences of childhood cancer. This hypothesis is based on the use of a surrogate method of estimating the historical level of residential magnetic field, using the physical characteristics of the nearby distribution wiring rather than actual magnetic field measurements. While some relationship between the magnetic fields in a house and the currents in nearby wires will clearly exist, the actual extent to which particular internal or external conductors will contribute to the residential environment, and by what mechanism, is not well understood. Until this information is available, the validity of he surrogate method is questionable and the above hypothesis must remain untested, at least in the short term. Two recent residential magnetic-field surveys designed to test the accuracy of surrogate wiring-code estimates in ranking homes are analyzed, and the results are used to suggest guidelines for the Source Characterization program. 4 refs., 1 tab.

46340 (UCRL–101717) **Exposures of totally-encapsulating chemical protective suits to high and very high concentrations of hydrogen fluoride along with future experimental plans.** Johnson, J.S.; Swearengen, P.M. Lawrence Livermore National Lab., CA (USA). 10 Aug 1989. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890814–3: American Institute of Chemical Engineer's summer national meeting, 20-23 Aug 1989). Order Number DE89016514/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We conducted a series of tests on nine commercial brands of totally-encapsulating chemical protective (TECP) suits under realistic worst-case exposures to hydrogen fluoride (HF). Most of the tests were carried out using a static mannequin in a large wind tunnel located at the US Department of Energy Liquefied Gaseous Fuels Spill Test Facility at the Nevada Test Site. Several tests were also conducted using another mannequin that articulated at the waist. HF leak-rates into the TECP suits were measured using an integrated field sampler and silica-gel sorbent tubes. At HF concentrations of ~10,000-30,000 ppM, we observed no significant TECP suit leakage. We experienced no field problems in conducting ASTM F1052-87 TECP pressure leak-rate tests. Several tests to determine if positive-pressure vent valves significantly improve TECP suit performance indicated little, if any, difference in leak-rate as compared to the standard vent valves. One final TECP suit exposure to very high concentrations of HF (>500,000 ppM) resulted in a major suit failure. Future laboratory and field experiments are planned to determine why this failure occurred, as well as to better define an experimental method to carry out worst-case TECP suit chemical exposures. 10 refs., 7 figs., 6 tabs.

46341 MUCK - a novel approach to co-kriging. Clark, I. (Geostokos Ltd., London (England)); Basinger, K.L.; Harper, W.V. pp. 658 of Geostatistical, sensitivity, and uncertainty methods for ground-water flow and radionuclide transport modeling. Proceedings. Buxton, B.E. (ed.) Battelle Memorial Institute, Columbus, OH (1989). From Geostatistical sensitivity and uncertainty methods for groundwater flow and radionuclide transport modeling conference; 15-17 Sep 1987.

Multivariate geostatistical estimation - co-kriging - has been used in practice for well over a decade. The technique as developed by Matheron has been documented in many case studies. There are disadvantages to the standard approach, however, not the least of which is that the variables which are measured must be sited at the same geographical location. For example, they will tend to measure all of them on the same samples. There are cases in which this type of information is not available. Indeed, the motivation for using a multivariate approach may be to specifically improve estimation in areas where few variables have been measured. A variation in co-kriging will be presented which does not place this restriction on the modeling and estimation processes. A case study will be given which includes the added complication of strong trend. Hence the acronym for this new method - Multivariate Universal Co-Kriging.

46342 (GS–89-1H) **Current research, part H. Frontier geoscience program, Queen Charlotte Islands, British Columbia.** Geological Survey of Canada, Ottawa, ON (Canada). 1989. 152p. (MICROLOG–89-02837). Available from Canadian Government Publishing Centre, Supply and Services Canada, Ottawa, ON, CAN K1A 0S9; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This compilation of reports from a program examining various aspects of the geology of the Queen Charlotte Islands includes papers on regional structure, stratigraphy, fossils, igneous intrusions, geochronometry, sedimentation, thermal structure, gravity measurements, and hydrocarbon potential. Separate abstracts have been prepared for three papers from this compilation. 3 conf. papers

46343 (GS–89-1H, pp. 87-94) **Sedimentological aspects of the Skonun Formation, Queen Charlotte Islands, British Columbia.** Higgs, R. (Cordilleran and Pacific Geoscience Div., Sidney, BC, Canada). Geological Survey of Canada, Ottawa, ON (Canada). 1989. (MICROLOG–89-02837). In *Current research, part H. Frontier geoscience program, Queen Charlotte Islands, British Columbia.* Available from Canadian Government Publishing Centre, Supply and Services Canada, Ottawa, ON, CAN K1A 0S9; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Oil-company boreholes in the Queen Charlotte Basin reveal a Miocene-Pilocene succession (Skonun Formation) up to 5 km thick, containing abundant sand bodies with reservoir potential. However, the depositional environment of the Skonun Formation, hence the geometry of the sand bodies, is poorly understood, partly because exposures and core are minimal. Three exposures are described. The facies include coal beds and rooted mudstones; these are interpreted as delta-plain deposits, suggesting that some of the subsurface sand bodies could be distributary channels and delta-front sands. Similarly, tidal-shelf sandstones are present at outcrop, suggesting that linear tidal sand ridges could occur at depth. Implications for hydrocarbon exploration are discussed. Iceberg dropstones occur in probable Upper Miocene strata at one locality, despite faunal evidence that the climate was temperate. This is thought to indicate that the northern Coast Mountains of British Columbia were sufficiently high in Late Miocene time to produce glaciers capable of reaching the sea. 20 refs., 5 figs.

46344 (ISPG–85-28) **Stratigraphy and structure of the mount Selwyn area, Rocky Mountains, northeastern British Columbia.** McMechan, M.E. Institute of Sedimentary and Petroleum Geology, Calgary, AB (Canada). 1987. 40p. (MICROLOG–87-04835). Available from Canadian Government Publishing Centre, Supply and Services Canada, Ottawa, ON, CAN K1A 0S9; $14.00; OTHER COUNTRIES: $16.80 CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Upper Proterozoic to Middle Jurassic, miogeoclinal, clastic and carbonate deposits, Upper Jurassic to Lower Cretaceous foredeep deposits, and Upper Cretaceous to Tertiary intermontane basin deposits outcrop in the Mount Selwyn area. Three structural levels, each characterized by distinctive structural styles, are recognized in the Rocky Mountains. Middle Devonian and older strata of the lower structural level form larger thrust sheets and folds. Predominantly incompetent, disharmonically folded and faulted Upper Devonian to Middle Triassic strata of the middle structural level have been shortened approximately twice as much as the folded , more competent, Upper Triassic to Upper Cretaceous strata of the upper structural level across the Foothills belt. Shortening across the Rocky Mountains is approximately 70 km. Pre-late Cretaceous strata exposed adjacent to and within the Rocky Mountain Trench were regionally metamorphosed to greenschist facies and penetratively deformed prior to Late Cretaceous-Paleocene thrust faulting in the Rocky Mountains. The disappearance of folded and faulted Upper Cambrian to Middle Devonian strata, and the folding of major thrust faults in the southern part of the Mount Selwyn area are probably a consequence of southeastward convergence in the position of ramps through Upper Proterozoic to Middle Devonian strata in the hanging walls of the Murray Range and Hidden faults, and the juxtaposition of the intervening deformed wedge of rock along a flat in the footwall of the Hidden Fault. Prospective structures for petroleum accumulation may occur at the leading edges of the "blind" (nonsurfacing) thrust sheets carrying Middle Devonian and older strata under the western part of the Foothills, and in faulted anticlines of Lower Carboniferous carbonate strata. 105 refs., 20 figs.

46345 (SGS–9, pp. 53-67) **Macrofossils and stratigraphic subdivisions of the Bakken Formation (Devonian-Mississippian), Williston Basin, North Dakota.** Thrasher, L.C. (U.S. Bureau of Land Management, Dickson, NS, USA). Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Over 500 macrofossils representing more than 50 taxa were collected from 39 cores in this study. Brachiopods, the most common, represent 17 genera, 11 of which have not been previously reported from the Bakken Formation. The fossils were found mostly within five stratigraphic intervals, each containing a different fauna. The basal few feet of the lower shale member locally contains a benthic rhynchonellid fauna that appears similar to fossils from near the base of Devonian black shales in the eastern USA. Foerstia sp., found in the basal 20-30% of the lower shale member in one core, appears to mark a widespread time-stratigraphic interval of Late Devonian age. Cyzicus (Lioestheria) sp. is prolific in the upper few inches of the lower shale near the Basin center; this species is concentrated at a similar interval in correlatives of the Bakken that crop out in the western interior region. The other fossiliferous intervals of the Bakken occur in the middle member and are found in association with lithologies that are used here to divide the middle member into three stratigraphic units. The lowest of these contains a Syringothyris similar to that of a Mississippi Valley limestone and to that in the siltstones of of Bakken correlatives in the western USA, both of latest Devonian age. The middle unit is poorly fossiliferous and an early Mississippian age is suggested. The top unit contains brachiopods that seem to correlate with those of early Mississippian age in other areas. It is suggested that these beds were deposited after a reorientation of the Bakken sea. Macrofossils in the upper shale member are generally small, thin-shelled and rare. 47 refs., 12 figs., 1 tab.

46346 (SGS–9, pp. 17-21) **Factors determining the thermal history of a continental basin.** Gosnold, W.D. (Univ. of North Dakota, Grand Forks, ND, USA); Huang, Y.C. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In theory, the thermal maturity of petroleum source rocks should be calculable if one can accurately determine the temperature profile for the source rock through time. Approaches using present day geothermal gradients or thermo-mechanical models have provided insight into aspects aspects of the thermal evolution of sedimentary basins. Problems in modeling basinal thermal history are addressed by analyzing the factors that control temperature profiles. A model for thermal evolution of the Williston Basin is used as an example of the effects of thermal conductivity structure and time-variation of thermal conductivity. The cccin can be divided into a high-conductivity, Paleozoic carbonate section and a low-conductivity, Mesozoic and Cenozoic clastic section. This structure causes a geothermal gradient profile that essentially has two components. The marked vertical variation in geothermal gradient structure precludes use of bottom-hole temperature data for estimating the thermal history of strata in the basin. Variation in sediment thermal conductivity in time is one-directional and is significantly influenced by sedimentation rate, compaction rate, and sediment composition and thickness. Thermal conductivity of the low-conductivity Basin

sediments increased ca 30% due to compaction during sedimentation. This time-varation in conductivity caused a gradual reduction in subsurface temperatures by about 20 degrees in the primary oil source rock during the early Tertiary. Application of the two-dimensional thermal model that includes variable thermal properties predicts a significantly different thermal maturity for the basin than does a simple model based on present geothermal gradients. 24 refs 3 figs 2 tabs

46347 (SGS–9, pp. 22-36) **Earliest Paleozoic history of the Williston Basin in North Dakota.** Lefever, R.D. (Univ. of North Dakota, Grand Folks, ND, USA); Thompson, S.C.; Anderson, D.B. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Deadwood Formation in the North Dakota (ND) portion of the Williston Basin ranges in thickness from zero to more than 270 m and represents the earliest recorded Paleozoic deposition in that area. Six correlatable units can be recognized. The Deadwood consists largely of siliciclastic rocks, and was deposited under marginal marine to offshore conditions. The Winnipeg Group unconformably overlies the Deadwood over most of ND and attains a maximum thickness of a 135 m in the centre of the Basin. The Group consists of three formations which are, in part, lateral facies equivalents. The initial subsidence of the Basin in ND occured at a time no later than late Tremadocian, and does not appear to have been associated with major orogenic events elsewhere in North America. The area of greatest subsidence seems to have been initially elongate, and to have become more circular by Winnipeg time. The Deadwood was deposited during a gradual major eustatic sealevel rise, which included several smaller-scale transgressive and regressive episodes. A major eustatic sealevel drop occurred at the end of the early Ordovician. Marine deposition in ND ceased, and Deadwood strata were eroded from the newly exposed areas of the Basin. By the late Ordovician, sealevel was rising again. In ND, the first evidence is the fluvial-deltaic deposits of the lower Black Island Formation, deposited in the area with the greatest amount of subsidence. With continued sealevel rise, these deposits were covered, and the shallow marine sandstones of the upper Black Island were deposited, followed by the deeper marine shales of the Icebox Formation and, finally, the argillaceous limestones of the Roughlock Formation. 52 refs 8 figs 1 tab

46348 (SGS–9, pp. 47-52) **Distinguishing between depositional and dissolution thinning. Devonian Prairie Formation, Williston Basin, North America.** Oglesby, C.A. (Colorado School of Mines, Golden, CO, USA). Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Abrupt lateral thickness variations within the Prairie Formation are common and caused by two disparate but distinguishable processes: differential accumulation of salt during deposition and differential removal of salt by dissolution. Recognition and prediction of dissolution and depositional thin areas are important to petroleum exploration and development. Indirect methods, utilizing well logs, provide the primary method for interpreting occurrences of the two processes. The results of this study indicate that the two processes can be distinguished using Prairie intraformational correlations. There are several regionally correlative shoaling upward sequences within the Prairie Formation. The lowermost begins with the transition from the Winnipegosis Formation laminated carbonates to the basin-centered Ratner anhydrite, followed by halite and culminating in the Esterhazy potash beds. Two overlying sequences also display shallowing upward trends. A fourth sequence is indicated by several additional feet of halite capping the Patience Lake member in some parts of the basin. Cross-sections show a regional, gradual decrease in thickness in the lower Prairie away from the basin depocenter, most simply explained by decreasing the subsidence rates away from the center and by depositional onlap of the Prairie toward the basin margins. By correlating the 4 sequences within the Prairie, some local thickness variations are shown to originate by depositional onlap onto Winnipegosis reefs. In other instances, the basal parts of the formation are preserved but the upper parts are progressively restricted. This pattern is explained by progressive dissolution of Prairie evaporites from the top downward. 18 refs., 10 figs.

46349 (SGS–9, pp. 190-195) **Late cenozoic erosion of Williston Basin sediments.** Clausen, E.N. (Minot State Univ., Minot, ND, USA). Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Evidence for deep erosion of sediments in the Williston Basin region incudes an erosion surface cutting across numerous stratigraphic units, a system of major escarpments, erosional remnants of previous topographic surfaces, and high-level drainage divides covered with alluvial sediments. Glacial erosion, aided by tremendous volumes of meltwater, probably scoured out systems of extremely wide and shallow glacial troughs on the northern Great Plains. These valleys are cut in the easily-eroded claystone bedrock of the region. Late Cenozoic climatic models indicate as many as 25 major glacial episodes during the past 3.2 million years. Continental icesheets probably advanced into the Williston Basin region during most, if not all, of those glacial episodes. Alpine icecaps probably covered the Rocky Mountain uplands during each of the glacial episodes. Meltwater from these alpine icecaps repeatedly crossed the Williston Basin region only to be diverted along the margins of continental ice sheets. Glacial meltwater rivers, emanating from alpine icecaps in the Rocky Mountain region, carried distinctive glacio-fluvial alluvium. Gravels, capping upland regions in eastern Montana and the western Dakotas and elsewhere were probably deposited when rivers, carrying such glacio-fluvial material, were diverted along continental ice margins. Evidence for early diversion of one such river, the Yellowstone River, can be found along the asymmetric drainage divide east of the Little Missouri River. Buttes, composed of sediments usually mapped as (Oligocene) White River Group, probably represent topographic inversions of early Yellowstone River valleys. The distinctive sediments record both the diversions of the rivers and the progressive lowering of the Williston Basin region landscape. 30 refs 1 tab

46350 (SGS–9, pp. 266-267) **Salinity, oxygenation, and topographic controls on Mississippian subtidal sedimentation in a portion of the Mission Canyon Formation, Williston Basin, North Dakota.** Fischer, H.J. (Univ. of North Dakota, Grand Forks, ND, USA); Luther, M.R.; Eylands, K.E.; Quinn, C.F. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A model is presented for the deposition of sublittoral rocks from the Mission Canyon Formation in the Billings and Bottineau-Renville County areas of North Dakota. The model calls for salinity to be the major factor controlling sedimentation patterns; the carbonate section developed during Mission Canyon time in response to a general increase in salinity with time, punctuated by rapid, periodic fluctuations in salinity that controlled lithofacies distribution within the carbonate succession. Local changes in other parameters accentuated effects of salinity changes and controlled local variations in lithology, organism distribution, sedimentary structures, and evaporate mineral distribution. The lateral, band-like distribution of facies

from the seaward to the landward parts of the formation is explained by bodies of water with different salinities and oxygen values, as explained by salinity gradients being established away from the margin of the epicontinental sea. Lateral migration of the salinity bands would cause vertical stacking of sediments showing different degrees of restriction as a particular chemical environment caused a specific lithofacies to form in a given area. 7 refs.

46351 (CEA-DAS-602) **Historical seismicity in Morocco: methodological aspects and cases of multidisciplinary evaluation.** Elmrabet, T.; Ramdani, M.; Tadili, B.; Levret, A. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete. May 1989. 22p. (CONF-8904264--: Symposium on the seismicity, seismotectonic and seismic risk of the Ibero-Maghrebian region, 12-14 Apr 1989). Order Number DE89908182/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Within the framework of a cooperative agreement between Sofratome and the Office National d'Electricite of Morocco, the Centre National de la Recherche of Rabat, with the collaboration of the French Institut de Protection et de Surete Nucleaire, was put in charge of compiling a revised catalogue of the historical seismicity of Morocco. The method adopted calls for the participation of several different disciplines in view of situating each earthquake in its own geographical and historical context. The approach entails, during the first stage involving primarily the historian, gathering together the original sources of data and subjecting them to a critical analysis in order to assess their reliability. The second stage consists in interpreting the information so as to define those earthquake characteristics that are requisite to seismic hazard studies. This latter evaluation must be the fruit of a multidisciplinary effort. This is particularly true for earthquakes of past centuries, the observations of which are frequently incompatible or biased and accordingly need to be substantiated by referring to information of a varying nature and, wherever possible, calibrated using accurate data from recent events. In a number of instances, duplications are encountered, or lumped effects for distinct events due to calendar misreckonings, erroneous copying, or misconceptions relative to the geological or historical context. A particularly significant example of the interference of these diverse aspects is afforded by the assessment of the destructive effects in Morocco of the 1755 'Lisbon' earthquake: a method is proposed for calibrating its intensities by comparing them with those of the recent 1969 event of similar origin.

46352 (EGG-10617-6065) **Systems control and receiving station: Quarterly report, April-June 1989.** Harrer, S.J. EG and G Energy Measurements, Inc., Albuquerque, NM (USA). Kirtland Operations. Jun 1989. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617. (KO-297-89). Order Number DE89016314/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

During this quarter the Norwegian Experimental Seismic System (NORESS) lost 171 hours and 37 minutes of data. The System Control and Receiving Station (SCARS) is continuing its efforts to copy the NORESS and Regional Seismic Test Network (RSTN) data onto optical disk. This quarter SCARS received the remaining Arctic Experimental Seismic System (ARCESS) data that were initially agreed upon from Norwegian Seismic Array (NORSAR) on magnetic tapes. Satellite transmission of the data is not expected. The Receiving and Monitoring Station (RAMS) is continuing its efforts in the software development for the Deployable Seismic Verification System (DSVS). RAMS is also involved in the data analysis of the seismometers for the DSVS project and the hardware check out. SCARS received 30 data requests involving 126 events. There, was 1 RSTN data request for a total of 1 event, 12 NORESS data requests for a total of 89 events, 7 ARCESS data requests for a total of 22 events, and 10 Seismic Test Unit (STU) data requests for 14 events. 4 figs., 1 tab.

Institutt for Kontinentalundersoekelser og Petroleumsteknologi A/S, Trondheim (Norway). Nov 1988. 126p. Order Number DE89914755/JAW. Available from NTIS (US Sales Only), PC A07/MF A01.

The digital navigation data base contains information of available regional shallow seismic lines on the Norwegian Continental Shelf. In all, 103.856 km of shallow seismic lines have been registrated in the data base. The report describes and demonstrates how to find the data coverage in an area of interest. An overview of all the navigation registrated in this digital navigation data base is given. The report presents listings of all lines, descriptions of all surveys and a distance listing for each survey. The shelf has been divided in four areas: North Sea, Mid-Norway, Troms (North Norway) and Barents Sea. 1 reference, 8 tables.

46354 (SAND-88-3482) **DMC [Distinct Motion Code]: A rigid body motion code for determining the interaction of multiple spherical particles.** Taylor, L.M.; Preece, D.S. Sandia National Labs., Albuquerque, NM (USA). Jul 1989. 38p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89016929/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The computer program DMC (Distinct Motion Code) determines the two-dimensional planar rigid body motion of an arbitrary number of spherical shaped particles. The code uses an explicit central difference time integration algorithm to calculate the motion of the particles. Contact constraints between the particles are enforced using the penalty method. Coulomb friction and viscous damping are included in the collisions. The explicit time integration is conditionally stable with a time increment size which is dependent on the mass of the smallest particle in the mesh and the penalty stiffness used for the contact forces. The code chooses the spring stiffness based on the Young's modulus and Poisson's ratio of the material. The ability to tie spheres in pairs with a constraint condition is included in the code. The code has been written in an extremely efficient manner with particular emphasis placed on vector processing. While this does not impose any restrictions on non-vector processing computers, it does provide extremely fast results on vector processing computers. A bucket sorting or boxing algorithm is used to reduce the number of comparisons which must be made between spheres to determine the contact pairs. The sorting algorithm is completely algebraic and contains no logical branching. 13 refs., 14 figs., 4 tabs.

46355 (CONF-8909173-1) **The solubility of gibbsite in aqueous sodium chloride solutions.** Palmer, D.A.; Wesolowski, D.J. Oak Ridge National Lab., TN (USA). 1989. 7p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From 11. international conference on the properties of steam (ICPS); 3-9 Sep 1989. Order Number DE89016226/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Knowledge of the thermodynamic properties of aqueous aluminum as a function of pH, temperature and salinity is essential in understanding the hydrothermal behavior of this ubiquitous element. Experimental studies of the thermodynamics of dissolution and hydrolysis of aluminum have relevance in modeling aqueous solutions found in geothermal power generating wells, the formation of hydrothermal ore deposits and the corrosion of aluminum substrates. Due to the extremely insoluble nature of hydrolyzed aluminum in near neutral solutions, solubility experiments are one of the few means of obtaining much of this information. As confirmed in this study, gibbsite [$Al(OH)_3$] is a stable solid phase at near ambient conditions (<100°C) with apparently very slow kinetics of transformation to the more stable form, corundum (Al_2O_3). 24 refs., 2 figs.

46356 (DOE/ER/13721-T1) **Petrology and emplacement dynamics of the intrusive and extrusive rhyolites of Obsidian**

Dome Inyo Craters volcanic chain, eastern California. Vogel, T.A.; Schuraytz, B.C.; Eichelberger, J.C.; Stockman, H.W.; Westrich, H.R.; Younker, L.W.; Horkowitz, J.P. Michigan State Univ., East Lansing, MI (USA). Dept. of Geological Sciences. 1989. 71p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER13721. Order Number DE89016277/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

Drilling at Obsidian Dome has provided continuous core samples of the distal and proximal portions of Obsidian Dome, its conduit, and an associated feeder dike. Both the dome and conduit are chemically and mineralogically zoned and consist of a finely porphyritic, high-Ba, low-silica rhyolite occurring in the basal portion of the dome and margins of the conduit and a finely porphyritic, low-Ba, higher silica rhyolite in the upper portion of the dome and center of the conduit. The high-Ba rhyolite contains two distinct phenocrysts assemblages with two distinct compositions, and represents mingled magmas. The low-Ba rhyolite in the dome and conduit contains significantly fewer disequilibrium phenocrysts and is only slightly mingled. The dike, sampled at 600 m depth, as well as a related tephra fall from Obsidian Dome vent, are entirely low-Ba rhyolite that contain no evidence of magma mingling. End members of the mingled magma, calculated using two different methods, are a 63 percent silica end member, and a silicic end member identical in composition to the dike and tephra fall from Obsidian Dome vent. This silicic end member was the first magma emplaced in the dike, and comprised much or all of the first magma vented to the surface during formation of the Obsidian Dome vent when eruption rates were high. Magma mingling of mafic and rhyolite magmas occurred during formation of the conduit. 59 refs., 16 figs., 10 tabs.

46357 (EC/NHR/S–87004) **Turkey Lakes water study. Hydrogeological instrumentation and aquifer materials.** Johnston, L.M.; Craig, D. Environment Canada, Saskatoon, SK (Canada). National Hydrology Research Inst. 1987. 31p. (MICROLOG–88-06244). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, CAN K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

57 wells (69 sampling points) ranging in depth from 0.5 to 9.7 m are currently in use in the Turkey Lakes Watershed ground water study. During the drilling program, 50 overburden samples were collected, freeze-dried and sieved into seven fractions. Each fraction was subjected to an acid-base titration to measure its relative acid neutralization capacity (ANC). The ANC, expressed as $\%CaCO_3$ by weight, increases with depth from 0.3% at one meter to 1.4% at seven meters. The average ANC value for each of the five main basins range from 0.6 to 1.3% by weight. X-ray diffraction analysis of the silt-clay fraction of selected samples showed quantities of montmorillonite and illite. 40 fractions, from 11 sites, contained inorganic carbon ranging from trace levels to 0.26% be weight. Organic carbon concentrations in the same fractions ranged from not detectable to 0.02%. Sulfur concentrations were below the detection limit of 0.02%. This report is intended to serve as a source of basic data for other scientists working in the area and provides a permanent record for the sites studied during the Long Range Transport of Atmospheric Pollutants Program. 14 refs., 5 figs., 5 tabs.

46358 Radiochemical study of biological crisis zones in the fossil record. Attrep, M. Jr. (Los Alamos National Lab., NM (USA)); Orth, C.J. pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809240–: Symposium on application of nuclear techniques to geochemistry, 25-30 Sep 1988).

The authors have been measuring elemental abundances in rock samples across biological crisis zones in the fossil record using the Los Alamos automated neutron activation analysis system for about 40 trace and common elements with radiochemical methods for Os, Ir, Pt and Au. We began our study soon after the Alvarez team reported their discovery of an Ir anomaly at the Cretaceous-Tertiary (K-T) boundary in European marine rock sequences; they hypothesized a large-body impact cause. After finding the Ir anomaly and evidence of an abrupt plant extinction in nearby continental K-T sequences, we turned our emphasis in 1981 to other extinction boundaries, and to date we have examined at least one section of most of the boundaries that pre-date the K-T event. These studies are generally done in collaboration with paleontologists and stratigraphers. We have located several pre-(K-T) Ir anomalies which we have attributed to terrestrial processes. Thus far, the results of this work do not support the recent hypotheses which suggest that the reported periodic extinctions (26 Ma) were caused by impacts from cyclic comet swarms in the inner Solar system.

46359 Adsorption of cesium and strontium on untreated and organic-extracted shales. Ho, P.C. (Oak Ridge National Lab., TN (USA)). pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809278–: American Chemical Society Division of Nuclear Chemistry and Technology, 25-30 Sep 1988).

Adsorption of Cs(I) and Sr(II) on untreated and organic-extracted shales in synthetic ground waters under oxic conditions was studied. The selected shales were Green River Formation, Chattanooga, Pierre, and two Conasauga Shales; they represent mineralogical and compositional extremes of shales. Synthetic brine made to simulate groundwater in the Conasauga Shale, a 100/l dilution of this brine, and 0.03 M $NaHCO_3$ were used as ground waters. According to mineralogical studies, the first three shales contain 5 to 13 wt% of organic matter, and the two Consasauga Shales contain only trace amounts. Soxhlet extraction with chloroform and a chloroform/methanol mixture removed ca 5 wt% organic matter from the total organic content of the first three shales. Adsorption of trace quantities of Cs(I) and Sr(II) on these shales shows that the distribution coefficients with untreated shales were moderate with Cs(I) in concentrated brine, moderate with Sr(II) in all three solutions, and significant with Cs(I) in the diluted brine and carbonate solution. The distribution coefficients decreased greatly after the shales were extracted with organic solvents. The decrease of adsorption is proportional to the amounts of organic matter removed.

46360 ^{137}Cs radioactive dating of lake core sediments. Ward, T.E. (Brookhaven National Lab., Upton, NY (USA)); Breeden, J.; Komisarcik, K.; Porter, R.; Czuczwa, J.; McVeety, B. pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809278–: American Chemical Society Division of Nuclear Chemistry and Technology, 25-30 Sep 1988).

The accurate knowledge of sedimentary geochemical processes and lake development can be obtained by studying the distribution of ^{137}Cs in sediment cores. ^{210}Pb dating and ambrosia pollen distributions compare well with ^{137}Cs techniques enabling determination of sedimentation rates with precision over the past 100 yrs or so in the Greater Lakes regions. The geochronology of environmental pollutants can be traced using this radiometric technique.

Available from NTIS (US Sales Only), PC A13/MF A01 - Norske sivilingenioerers forening, pb. 2312 Solli, 0201 Oslo 2.

The paper deals with the development of an all-automated topographic sea bed mapping system used on the Norwegian continental shelf. The operation requirements for the various units in the system are described, and a digital surface model is used in the data processing.

46363 (ORNL/FTR–3342) **[Evaluation of the North Atlantic seasonal nitrogen model (Version 2)]: Foreign trip report, July 17–21, 1989.** Fasham, M.J.R. Oak Ridge National Lab., TN (USA); Institute of Oceanographic Sciences, Wormley (UK). 29 Jul 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89016157/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The results of version 2 of the three-dimensional North Atlantic Seasonal Nitrogen Model were compared with chlorophyll distributions derived from Coastal Zone Optical Scanner (CZOS) images and found to be in better agreement than the version 1 results. Also, the model gave a more realistic simulation of regenerated primary production, giving a geographically averaged f-ratio of 0.4 compared with 0.78 for version 1. Although the qualitative agreement between the model and data was good, there were areas of significant quantitative disagreement. A number of possible reasons for this were discussed, and future model runs were determined to test these hypotheses.

46364 (AD-A–207876/4/XAB) **Filament eruptions and the impulsive phase of solar flares. Report for 18 May 1987-17 May 1988.** Kahler, S.W.; Moore, R.L.; Kane, S.R.; Zirin, H. Emerson Radio and Phonograph Corp., Jersey City, NJ (USA). 30 Jun 1988. 29p. (SCIENTIFIC–1). Available from NTIS, PC A03/MF A01.

We examine the observed development of filament eruptions in the impulsive phase of flares for evidence of how the eruption is driven. A possibility sometimes adopted as working hypothesis is that the filament eruption and accompanying coronal mass ejection are consequences of energy release in the flare impulsive phase; they are taken to be ejecta in the explosion resulting from the pressure pulse from plasma heating in the flare. Evidence against this view is from four flares in which, in H-alpha movies, a filament eruption was observed during the flare impulsive phase defined by the E = approx. 30 keV hard x-ray emission observed with the U. of Calif. at Berkely detector on the ISEE 3 spacecraft. In each case it was found find that: (1) filament eruption began before onset of the impulsive phase; (2) eruptive motion is consistent with a smooth evolution through the impulsive phase, accelerating, but showing no new acceleration attributable to the impulsive phase; (3) brightening of the H alpha flare ribbons in the impulsive phase occurring in compact areas is much smaller than the overall span of the erupting filament; and (4) the observed projected speed is on the order of 100 km/s at the onset of the impulsive phase. These characteristics indicate that filament eruption is not driven by flare plasma pressure, but instead marks an eruption of magnetic field driven by a global MHD instability of the field configuration in the flare region. It appears that filament eruption and impulsive energy release are coordinated and driven by a common cause, the instability of the whole field configuration. A new mode of energy release, that of the impulsive phase, may be initiated when the eruptive motion surpasses some speed limit of order 100 km/s.

46365 (AD-A–207955/6/XAB) **Detection of CMES (coronal mass ejections) in the interplanetary medium from 1976-1979 using HELIOS-2 photometer data.** Webb, D.F.; Jackson, B.V. Emmanuel Coll., Boston, MA (USA). 28 Aug 1987. 7p. (SCIENTIFIC–2). Available from NTIS, PC A02/MF A01.

Pub. in Proceedings of the International Solar Wind Conference (6th), 267-271(28 Aug 1987).

The use of HELIOS-2 (H2) zodiacal light photometer data to detect solar coronal mass ejections (CMEs) in the interplanetary (IP) medium is described. Data from the north ecliptic pole (+90 deg) photometer are used to identify transient flux increases which are interpreted as plasma clouds of Thomson-scattered electrons enveloping the spacecraft or passing north of it. These data are used to study the characteristics of CMEs in the IP medium during a 4-year period, from 1976 through 1979, covering a gap in coronagraph observations. Most of the WL transients were also detected at the spacecraft as in-situ plasma enhancements, with significant rotation of the IMF and evidence for the passage of magnetic clouds. The extrapolated solar-source regions of the transients were often associated with bright, long-lived coronal regions which define the heliomagnetic equator. Finally, the occurrence rate of IP CMEs increased toward solar maximum, with the 1979 HELIOS and SOLWIND CME rates in basic agreement.

46366 (AD-A–207956/4/XAB) **Observations of coronal mass ejections near the sun.** Kahler, S. Emmanuel Coll., Boston, MA (USA). Physics Research Div. 28 Aug 1987. 19p. (SCIENTIFIC–3). Available from NTIS, PC A03/MF A01.

Pub. in Proceedings of the International Solar Wind Conference (6th) (28 Aug 1987).

The appearance and properties of coronal mass ejections (CMEs) near the sun provide clues for their subsequent development in interplanetary space. Observational results are now available for which most, but not all, of a solar cycle. The statistics concerning angular sizes, latitudes, and occurrence rates were compiled, but significant differences between the Skylab/SMM and SOlwind results remain. The structure of classic loop-like CMEs consists of three parts: the bright loop, a dark void, and a bright core, which correspond to coronal loop, prominence cavity, and prominence, respectively. In a few instances the late stages of CMEs have been interpreted as disconnection events with a pinching off of the magnetic field lines and the formation of a closed structure which moves into the interplanetary. Several lines of evidence now show that CMEs have a significant three-dimensional structure rather than something close to a planar shape. While the sources of cool material in CMEs are readily identified with the erupting prominences, the solar sources of hot material observed in the driver gas to interplanetary shocks are not so obvious. The leading edges of CMEs are frequently preceded by waves or shocks which produce deflections in coronal streamers. The relationship between CMEs and type II burst shocks is unclear, however, since some fast CMEs do not result in type II bursts and some type II bursts are not associated with CMEs.

46367 (AD-A–208151/1/XAB) **Solar-cycle variation of long-duration 10.7-cm and soft x-ray bursts.** Kahler, S.; Cliver, E.W. Emmanuel Coll., Boston, MA (USA). 1988. 13p. (SCIENTIFIC–4). Available from NTIS, PC A03/MF A01.

Pub. in Solar Physics, Vol. 115, 385-396(1988).

Gradual rise-and fall (GRF) microwave bursts and long-duration soft x-ray events (LDEs) are generally accompanied by solar coronal mass ejections (CMEs). Reports from the Ottawa and Penticton stations are used to examine the annual variations from 1965 to 1985 of 10.7-cm GRF bursts with total durations of at least 4 hr. The annual numbers of such bursts are well correlated with the quiet-Sun 10.7-cm flux densities. This result is in contrast with the finding of Koomen et al. (1985) that the annual numbers of > or = 4 hr GOES soft x-ray events are not well correlated with sunspot numbers. We show that the latter result is biased by the large variation of the quiet-Sun x-ray background throughout the solar cycle. Four-hour events are more easily detected in x-ray data than in 10.7-cm data at solar minimum, but, conversely, these events are much more easily detected in 10.7-cm data around solar maximum. About 70% of the most energetic CMEs are associated with > or = 4-hr x-ray or 10.7-cm bursts. A one-to-one relationship does not exist between CMEs and either LDEs or GRF bursts viewed in full-Sun detectors.

46368 (DOE/ER/60590–T1) **Long-term solar-terrestrial observations.** National Research Council, Washington, DC (USA). Panel on Long-Term Observations. 1988. 72p. Sponsored by U.S. DOE Energy Research. DOE Contract AI01-87ER60590. Order Number DE89016318/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

In the fall of 1985, the Committee on Solar-Terrestrial Research (CSTR) created a panel to study the requirements for long-term

monitoring and archiving of solar-terrestrial data. The panel comprised specialists in all four areas that constitute solar-terrestrial science: the sun, interplanetary medium, magnetosphere-thermosphere-ionosphere, and upper atmosphere. It interviewed many individuals from the solar-terrestrial monitoring and data archiving communities, along with administrators and directors from appropriate government agencies. It circulated nearly 500 questionnaires to obtain information and opinions from the broader community to learn which observational data should be considered essential over the long term to support the operational and research needs of solar-terrestrial science. This report summarizes the panel's principal findings, and the panel's recommendations follow. A separate section listing the critical observational needs by area is presented together with the scientific rationale for each area. The recommendations are defended in terms of this explicit scientific rationale and the multifold uses of current and long-term solar-terrestrial observations for continued operational solar-terrestrial forecasts and services. Finally, the panel addresses the question of setting priorities among the critical set of observations during periods of low or declining scientific budgets. Here the most important criterion is the recognition that the field must allocate funding to support new research at the same time that it is acquiring the high-priority data sets over the long term.

46369 (IFT-TM–02/87) **Cosmological model with Einstein - De Sitter metric and closed spatial section.** Wichoski, U.F. Instituto de Fisica Teorica, Sao Paulo, SP (Brazil). Mar 1987. 139p. (In Portuguese). Order Number DE89635901/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

From the hypotesis that our Galaxy, in an early stage of its evolution, was a quasar, our model expects that images of this stage can still be observed in the sky. Thus, we look in a quasar catalogue for the ones that can possibly be interpreted as images of our Galaxy in that stage, with a view to determine the parameters of the model. (author).

46370 (INIS-BR–1559) **Model of a black hole gas submitted to background gravitational field for active galaxy nuclei with application to calculating the continuous emission spectra of massless particles (Photons: neutrinos and gravitons).** Pinto Neto, A. Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica. 1987. 163p. (In Portuguese). Order Number DE89635902/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

A new theoretical model for active galaxy nuclei which describes the continuous spectrum of rest massless particles (photons, neutrinos and gravitons) in the frequency range from radiofrequency to gamma ray frequency, is presented. The model consists in a black hole gas interacting with a background gravitacional field. The previously models proposed for active galaxy nuclei are exposured. Whole theoretical fundaments based on Einstein general relativity theory for defining and studying singularity properties (black holes) are also presented. (M.C.K.).

46371 (INIS-BR–1572) **Study of primitive universe in the Bianchi IX model.** Matsas, G.E.A. Instituto de Fisica Teorica, Sao Paulo, SP (Brazil). Mar 1988. 114p. (In Portuguese). Order Number DE89635903/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

The theory of general relativity is used to study the homogeneous cosmological model Bianch IX with isometry group SO(3) near the cosmological singularity. The Bogoyavlenskii-Novikov formalism to explain the anusual behaviour of the Liapunov exponent associated with this chaotic system, is introduced. (author).

46372 (KEK–88-10, pp. 302-307) **Study of invisible axions in the galaxy.** Inagaki, S. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Kobayashi, M.; Shintomi, T.; Ezura, E.; Satoh, I.; Yoshimura, M. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The recent astronomical and astrophysical studies strongly support the existence of non-luminous mass in the universe. As to the constituents of the non-luminous mass, two concepts are opposing: the hot and cold darkmatter. Axions are one of the candidates of the cold dark matter. The present report outlines predicted properties of the galactic axions and the present status of the detection program at KEK. In the program, a cylindrical cavity with 15.0 cm inner diameter is made, which was selected to make full use of the existing 5.2T superconducting solenoid. The TM_{010} mode of the cavity is tunable from 1,53GHz to 1.14GHz using a 2.0 cm diameter sapphire rod. However, there are several stop bands due to unidentifiable parastic modes. The Q-value of the empty cavity at room temperature is 97.6% of the theoretical value. Though it does not look easy to improve the sensitivity by the order of two, the authors persist in the superheterodyne method for rf signal detection. Two FET amplifiers are made to obtain a noise temperature below 10degK with a gain more than 30dB in the region 1.2-1.7GHz. After the amplification of about 60dB at cryogenic temperature, the signal is modulated to 30MHz by an image rejection mixer and amplified another 60dB. Then the IF is converted to 30kHz. By 64 channel filters, the output signal are spectrum-analyzed, sampled by CAMAC modules and stored in optical disks. The data are processed off-line after an appropriate data storage. (N.K.).

46373 (KFKI–1989-21/C) **Analysis of the neutral gas measurements near comet P/Halley based on observations by VEGA-1.** Gringauz, K.I.; Verigin, M.I.; Remizov, A.P.; Oraevskij, A.A.; Richter, A.K.; Szegoe, K.; Varga, A.; Grard, R. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Apr 1989. 46p. Order Number DE89635843/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The in-situ measurements of secondary electrons and sputtered ions caused by impacts of neutral particles on metallic surfaces of the Ram Faraday Cup and Plasma Impact Detector sensors in PLAZMAG-1 instrument aboard VEGA 1,2 spacecraft are used to estimate neutral particle density distribution (n_n) around comet P/Halley up to distances of approximately $3x10^{\sigma}$ km. Asymmetries in n_n distributions along inbound and outbound legs of spacecraft trajectory are attributed to solar radiation pressure. A model calculation, taking into account solar radiation pressure, leads to 'tear drop' shaped distribution of neutral particles around the cometary nucleus. (author) 46 refs.; 11 figs.

46374 (LA-UR–89-2246) **MOXE: An x-ray all-sky monitor for Soviet Spectrum-X-Gamma Mission.** Priedhorsky, W.; Fenimore, E.E.; Moss, C.E.; Kelley, R.L.; Holt, S.S. Los Alamos National Lab., NM (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908120–2: SPIE conference on EUV, X-ray, and gamma ray instrumentation for astronomy and atomic physics, 7-11 Aug 1989). Order Number DE89015241/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We are developing a Monitoring X-Ray Equipment (MOXE) for the Soviet Spectrum-X-Gamma Mission. MOXE is an X-ray all-sky monitor based on array of pinhole cameras, to be provided via a collaboration between Goddard Space Flight Center and Los Alamos National Laboratory. Our objectives are to alert other observers on Spectrum-X-Gamma and other platforms of interesting transient activity, and to synoptically monitor the X-ray sky and study long-term changes in X-ray binaries. MOXE will be sensitive to sources as faint as 2 milliCrab (5σ) in 1 day, and cover the 2-20 keV band. 30 refs., 4 figs.

46375 (LA-UR–89-2517) **Inclusion of photon production and transport and (e^+e^-) pair production in a particle-in-cell code for astrophysical applications.** Sulkanen, M.E.; Gisler, G.R. Los Alamos National Lab., NM (USA). 1989. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890931–3: 13. conference on the numerical simulation of plasmas, 17-20 Sep 1989). Order Number DE89015293/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This present study constitutes the first attempt to include, in a particle-in-cell code, the effects of radiation losses, photon production and transport, and charged-particle production by photons scattering in an intense background magnetic field. We discuss the physics and numerical issues that had to be addressed in including these effects in the ISIS code. Then we present a test simulation of the propagation of a pulse of high-energy photons across an intense

magnetic field using this modified version of ISIS. This simulation demonstrates dissipation of the photon pulse with charged-particle production, emission of secondary synchrotron and curvature photons and the concomitant momentum dissipation of the charged particles, and subsequent production of lower-energy pairs. 5 refs.

46376 (LA-UR–89-2825) **Solar opacities constrained by solar neutrinos and solar oscillations.** Cox, A.N. Los Alamos National Lab., NM (USA). 15 Aug 1989. 15p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-890520–1: International conference: inside the sun, 22-26 May 1989). Order Number DE89016988/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This review discusses the current situation for opacities at the solar center, the solar surface, and for the few million kelvin temperatures that occur below the convection zone. The solar center conditions are important because they are crucial for the neutrino production, which continues to be predicted about 4 times that observed. The main extinction effects there are free-free photon absorption in the electric fields of the hydrogen, helium and the CNO atoms, free electron scattering of photons, and the bound-free and bound-bound absorption of photons by iron atoms with two electrons in the 1s bound level. An assumption that the iron is condensed-out below the convection zone, and the opacity in the central regions is thereby reduced, results in about a 25 percent reduction in the central opacity but only a 5 percent reduction at the base of the convection zone. Furthermore, the p-mode solar oscillations are changed with this assumption, and do not fit the observed ones as well as for standard models. A discussion of the large effective opacity reduction by weakly interacting massive particles also results in poor agreement with observed p-mode oscillation frequencies. The much larger opacities for the solar surface layers from the Los Alamos Astrophysical Opacity Library instead of the widely used Cox and Tabor values show small improvements in oscillation frequency predictions, but the largest effect is in the discussion of p-mode stability. Solar oscillation frequencies can serve as an opacity experiment for the temperatures and densities, respectively, of a few million kelvin and between 0.1 and 10 g/cm^3. Current oscillation frequency calculations indicate that possibly the Opacity Library values need an increase of typically 15 percent just at the bottom of the convection zone at 3 x 10^{6}K. 41 refs., 15 figs., 1 tab.

46377 (N–89-16965) **Photoabsorption and photodissociation of molecules important in the interstellar medium. Annual report, 15 January 1988-14 January 1989.** Lee, L.C.; Suto, M. San Diego State Univ., CA (USA). Feb 1989. 54p. (NASA-CR–184771;NAS–1.26:184771). Available from NTIS, PC A04/MF A01.

Photoabsorption and fluorescence cross sections of molecules important in the interstellar medium were measured in the 90 to 200 nm region using synchrotron radiation, excimer laser, and condensed discharge lamps as light sources. The quantitative spectroscopic data are currently needed for the modeling of formation and destruction rates of molecules by the interstellar radiation field. Fluorescences from excited photofragments produced by vacuum ultraviolet radiation of molecules are dispersed to identify the emitting species. The fluorescence data are useful for the identification of emission sources in interstellar clouds.

46378 (N–89-22545) **The shocking development of lithium (and boron) in supernovae.** Dearborn, D.S.P.; Schramm, D.N.; Steigman, G.; Truran, J. Lawrence Livermore National Lab., CA (USA). Feb 1989. 16p. (NASA-CR–183330;NAS–1.26:183330). Available from NTIS, PC A03/MF A01.

It is shown that significant amounts of Li-7 and B-11 are produced in Type 2 supernovae. The synthesis of these rare elements occurs as the supernova shock traverses the base of the hydrogen envelope burning He-3 to masses 7 and 11 via alpha capture. The yields in this process are sufficient to account for the difference in lithium abundance observed between Pop 2 and Pop 1 stars. Since lithium (and boron) would, in this manner, be created in the same stars that produce the bulk of the heavy elements, the lithium abundance even in old Pop 1 stars would be high (as observed). The B-11 production may remedy the long-standing problem of the traditional spallation scenario to account for the observed isotopic ratio of boron. Observational consequences of this mechanism are discussed, including the evolution of lithium and boron isotope ratios in the Galaxy and the possible use of the boron yields to constrain the number of blue progenitor Type 2 supernovae.

46379 (PB–89-139950/XAB) **Solar-Geophysical Data Number 531, November 1988. Part 2 (comprehensive reports). Data for May 1988, and miscellaneous.** Coffey, H.E.; McKinnon, J.A. National Geophysical Data Center, Boulder, CO (USA). Nov 1988. 61p. (SGD–531-PT-2). Available from NTIS, PC A04/MF A01.

See also Part 1, PB–89-139943.

Contents include: detailed index for 1988: data for May 1988 (Meudon carte synoptique, solar flares, solar radio bursts at fixed frequencies, solar x-ray radiation from GOES satellite, mass ejections from the sun, active prominences and filaments).

46380 (UCRL–100710) **Bragg crystal polarimeters.** Silver, E.; Simionivici, A.; Labov, S.; Novick, R.; Kaaret, P.; Martin, C.; Hamilton, T.; Weisskopf, M.; Elsner, R.; Beeman, J.; Chanan, G.; Manzo, G.; Costa, E; Perola, G.; Fraser, G. Lawrence Livermore National Lab., CA (USA). 15 Jun 1989. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890836–5: 33. SPIE annual international technical symposium on optical and optoelectronic applied science and engineering, 6-11 Aug 1989). Order Number DE89015775/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A Bragg crystal oriented at 45° to an incoming beam of x-rays acts as a polarization analyzer. This crystal geometry preferentially reflects those x-rays which satisfy the Bragg condition and whose electric vectors are perpendicular to the plane defined by the incident and reflected photons. X-rays with electric vectors parallel to this plane of incidence are photoelectrically absorbed. The energy bandwidth of nearly perfect crystals is extremely small which makes them very inefficient x-ray polarimeters. This limitation is particularly acute for observations of the relatively weak x-ray continuum of stellar sources. The bandwidth can be greatly increased by employing mosaic or ideally imperfect crystals. Mosaic crystals possess a high integrated reflectivity which results in a large increase in the reflection of continuum radiation. A review of the theory and performance characteristics of crystal polarimeters designed for observations of cosmic x-ray sources is presented. 17 refs., 9 figs., 4 tabs.

46381 (UCRL–100983) **Equation-of-state data of synthetic uranus.** Nellis, W.J.; Mitchell, A.C. Lawrence Livermore National Lab., CA (USA). Jun 1989. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890798–8: AIRAPT and EHPRG international high pressure science and technology conference, 17-21 Jul 1989). Order Number DE89016509/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

New equation-of-state data for the liquid mixture we call synthetic Uranus is discussed. This liquid was double-shocked to 220 GPa and 3 g/cm^3. These data are coincident with the adiabat of Uranus calculated by Hubbard and Marley. 7 refs.

46382 (AD-A–208083/6/XAB) **Monostatic observation of the F-region structure. Professional paper.** Paul, A.K. Naval Ocean Systems Center, San Diego, CA (USA). Aug 1988. 6p. Available from NTIS, PC A02/MF A01.

Pub. in Radio Science, Vol. 23, No. 4, 580-584(Jul-Aug 1988).

F-region parameters can change by relatively large amounts over short periods of time (fraction of an hour) under so-called undisturbed conditions. There is evidence that these changes are due to propagating acoustic gravity waves. While the periods of these variations and other local parameters (Doppler velocity and angle of arrival) can be measured with a high-resolution digital ionosonde, other quantities like wavelength or magnitude and direction of the propagation velocity cannot be observed. The Clarke Lake radio astronomical antenna array which can be operated in the HP band allows tracking the motion of medium-scale (100-500 km) disturbances by observation of the changes in the apparent position of radio stars. Some first data samples were recorded and analyzed.

46383 (AD-A-208187/5/XAB) **Medium-scale structure of the F-region.** Paul, A.K. Naval Ocean Systems Center, San Diego, CA (USA). Mar 1989. 23p. Available from NTIS, PC A03/MF A01.

Data collected during 1980/81 at Brighton, Colorado, show clearly that the F-region variations are undersampled in space and time by standard recording procedures. Fast temporal changes, with periods as short as 10 minutes, are directly observable if ionograms are taken in rapid sequences of a least 12 ionograms per hour. In order to obtain a correct spatial sampling, the distances between observing stations should not be much larger than 100 kilometers. This conclusion is derived from the temporal variations of F-layer parameters assuming a propagation velocity typical for acoustic gravity waves. Some direct estimates of a spatial structure scale can be obtained from angle of arrival measurements. Comparisons of foF2 and MUF(3000) indicate that the main effect of gravity waves on the F-region structure is the variation of the height of the layer and to a lesser degree a variation of the maximum electron density.

46384 (IC-89/33) **Modelling of the effects of the equatorial electrojet on its environment.** Bestman, A.R. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 20p. Order Number DE89636298/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The effect of the equatorial electrojet on the velocity vector and the temperature of the surrounding environment is modelled by the classical magnetohydrodynamic equations. Under the assumption of small hydrodynamic and magnetic Reynolds numbers and an electrojet magnetic field which oscillates along its axis, z, the nonlinear governing equations are solved by asymptotic approximation. The effect of the intensity of the magnetic field, inter alia, on the flow variables are deduced quantitatively. For example, when the field intensity is small, the temperature distribution is large and vice versa. Also at the higher approximation, there is a component of the flow variables which is completely independent of the axis, z, of the magnetic field variation. Since the classical equation for the temperature is quite similar to the mass diffusion equation, the present study also sheds light on the effect of the electrojet on the atmospheric ozone in its vicinity. Indeed the thermal field and the ozone concentration are affected similarly. (author). 17 refs, 2 figs.

46385 (INPE-3849) **Study on plasmaspheric electric fields and theirs influences on charged particle dynamics.** Mendes Junior, O. Instituto de Pesquisas Espaciais, Sao Jose dos Campos, SP (Brazil). Apr 1986. 132p. (In Portuguese). Order Number DE89636299/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

An analysis of plasmaspheric electric field measurements obtained by the S3-3 satellite in 1976-77, at L approx. 2 an during periods of intense geomagnetic activity, is presented. It is concluded that these measurements must have contributions both of the penetration electric field, associated with convection at the outer magnetosphere, as well as of the fields due to the 'disturbed' ionospheric dynamo. A study of the dynamics of electrons (within 10^{-1} to 10^{2} KeV) and protons (within 10^{-1} to 10^{2} KeV) inside the plasmasphere is also presented. It is concluded that, during quiet geomagnetic periods, electrons tend to corrotate with the Earth and simultaneously drift away from it. On the other hand, protons show a more complex dynamical behaviour, strongly depending on energy and on local time; presenting open orbits, similar to those of the electrons, except for an energy range in which closed orbits exist within determinate intervals of local time. During magnetically disturbed periods, the behaviour of electrons and protons remain approximately unaltered, although the energy intervals for which the open and closed orbits of protons occur get shifted. (author).

46386 (AD-A-207663/6/XAB) **Differential cross sections for secondary electron production by 1.5-keV electrons in water vapor.** Hollman, K.W.; Kerby, G.W.; Rudd, M.E.; Miller, J.H.; Manson, S.T. Georgia State Univ., Atlanta, GA (USA). Dept. of Physics. 1 Oct 1988. 5p. Available from NTIS, PC A02/MF A01.

Pub. in Physical Review A, Vol. 38, No. 7, 3299-3302(1 Oct 1988).

Discrepancies between previous experimental values of differential cross sections for electron-impact ionization of water vapor and recent model calculations have been largely resolved. A new measurement with improved suppression of spurious electrons has removed most of the discrepancy in the midrange of detected electron energies. A second discrepancy at secondary energies just below the primary energy has been explained by a more accurate accounting for electrons scattered at angles between zero and the minimum angle of the experimental apparatus. The improved data show more clearly the oxygen K-shell edge in the spectra at small angles and the Bethe ridge at angles up to 90 deg. The forward peak seen in the earlier data is no longer present.

46387 (AD-A-207846/7/XAB) **Hydrogen adsorption at Nb(100): Photoemission evidence of two-stage exchange involving subsurface states.** Fang, B.S.; Ballentine, C.A.; Erskine, J.L. Texas Univ., Austin, TX (USA). Dept. of Physics. 1988. 9p. Available from NTIS, PC A02/MF A01.

Pub. in Surface Science Letters, Vol. 204, L713-L720(1988).

Temperature-dependent properties of electronic states resulting from hydrogen adsorption of Nb(100) surfaces were studied by photoemission spectroscopy using synchrotron radiation. The most prominent hydrogen-induced feature in photoemission spectra exhibits a temperature dependence that requires contributions from two distinct states. Analysis of the photon energy-dependent cross section of the hydrogen-induced features suggests that hydrogen chemisorption sites are located below the surface. These results have important consequences for kinetic models that attempt to account for hydrogen uptake by Nb.

46388 (CONF-890829-1) **Production and stability of S_2F_{10} in SF_6 corona discharges.** Sauers, I.; Siddagangappa, M.C.; Harman, G.; Van Brunt, R.J.; Herron, J.T. Oak Ridge National Lab., TN (USA). 1989. 4p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From 6. international symposium on high voltage engineering (ISHVE-6); 28 Aug - 1 sep 1989. Order Number DE89016851/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We report the yield of S_2F_{10} produced in corona discharges in SF_6 and the dependence of the S_2F_{10} yield on various parameters. The data were obtained from two experimental systems, both employing point-to-plane geometry: (1) a small corona cell (200-ml in volume) with a gas chromatograph-thermal conductivity analyzer (GC-TCD) at ORNL and (2) a large corona cell with a gas chromatograph-mass spectrometer (GC-MS) analyzer at NIST (formerly NBS). The GC-MS technique was found to be quite sensitive to S_2F_{10} when the mass analyzer was turned to mass 86 (SOF_2^+). The mechanism for conversion of S_2F_{10} into SOF_2 at the end of the GC column is not yet understood. In both experiments, the concentration of S_2F_{10} increased linearly with time. However, the charge rate-of-production appeared to depend on uncontrollable factors such as moisture content. Although the thermal decay of S_2F_{10} is predicted to be very slow (10^7 year half-life at 23°C), surface processes may account for an increase in the S_2F_{10} decomposition rate. 13 refs., 6 figs., 2 tabs.

46389 (CONF-890829-2) **Influence of water vapor and decomposition products on the positive- and negative-ion spectra of SF_6 corona.** Sauers, I.; Siddagangappa, M.C.; Harman, G. Oak Ridge National Lab., TN (USA). [1989]. 4p. Sponsored by U.S. DOE Conservation & Renewable Energy. DOE Contract AC05-84OR21400. From 6. international symposium on high voltage engineering (ISHVE-6); 28 Aug - 1 sep 1989. Order Number DE89016879/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We report on the positive- and negative-ion spectra obtained from in-situ mass spectrometric analyses of ions sampled from corona discharges in SF_6 at P = 6.7 kPa (50 Torr). In positive-ion spectra the presence of water vapor results in the formation of water cluster ions of the form $H^+(H_2O)_n$. The distribution of cluster sizes shifts to smaller clusters as the water vapor content decreases. In addition to the SF_6 fragment ions (SF_5^+, SF_3^+, and SF_2^+), which are observed under relatively dry conditions, the hydrated species $SF_5^+(H_2O)$ is observed down to water additions of only 40 ppM, the

lowest concentration studied. In addition, the ion detected at mass 197 is believed to be the complex $SF_3^+(SF_4)$ where SF_4 is an important neutral by-product of SF_6 discharges. In negative-ion spectra, the influence of water vapor is manifested indirectly by the formation of HF clusters of the form $F^-(HF)_n$. Other clustered species observed include $OH^-(H_2O)_n$ and $OH^-(HF)_n$. The role of other decomposition by-products, such as SOF_4 and SO_2, of SF_6 corona on the positive- and negative-ion spectra will also be discussed. 11 refs., 6 figs., 1 tab.

46390 The stark effect in atoms at extremely high intensities: Ponderomotive potentials and all that. Freeman, R.R. (AT & T Bell Laboratories, Murray Hill, NJ (USA)). pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Recent measurements of the kinetic energies of photoelectrons produced in multiphoton ionization of the rare gases for ultra-short ($\leq$ 250 femtosec), high intensity ($\approx 10^{14}$W/cm^2) light near 616 nm reveals a complex spectra, rich in structure with some features so narrow in energy that they are limited by the spectrometer resolution. In this paper the author shows that this thoroughly unanticipated result is a signature of a general phenomena, one that is present (but often hidden) in all multiphoton experiments regardless of the pulse length employed in the particular experiment. Further, he argues this phenomena is directly related to the ponderomotive potential associated with the wiggle motion that an electron executes under the influence of an intense optical field. 12 refs., 4 figs.

46391 Search for x-rays generated by collisionless multiphoton processes. Lee, P.H.Y. (Los Alamos National Lab., NM (USA)); Casperson, D.E.; Schappert, G.T. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). DOE Contract W-7405-ENG-36. From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The authors have conducted photon counting experiments to search for x-rays which may be generated by either collisionless multiphoton induced inner-shell processes or bremsstrahlung at high laser irradiance. Using KrF light at an irradiance $\sim 3 \times 10^{17}$ W/cm^2 on low density Xe gas targets, they detect no prompt photons which are characteristic of these processes.

46392 Investigations of multiphoton excitation and ionization in a short range potential. Susskind, S.M. (Princeton Univ., NJ (USA)); Cowley, S.C.; Valeo, E.J. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). DOE Contract AC02-76CH03073. From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The authors introduce an approach to the study of excitation and ionization for a system containing a model confining potential consisting of a set of δ-functions. In particular, analytical and numerical results are presented for the multiphoton ionization rate, under strong field conditions, of an electron confined by a δ-function potential. 10 refs., 3 figs.

46393 Multiphoton spectroscopy of multielectron atoms and the quest for direct two-electron ejection. Lambropoulos, P. (Univ. of Southern California, Los Angeles (USA)). pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The author presents a brief review of recent high intensity experiments showing the participation of multiphoton resonances with bound atomic states. The results compare favorably with some of our calculations on rare gases and alkaline earths. 11 refs.

46394 Symmetries and asymmetries in above-threshold ionization. Bucksbaum, P.H. (AT & T Bell Laboratories, Murray Hill, NJ (USA)); Bashkansky, M.; Schumacher, D.W. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Angular distributions of atomic-electrons photoionized above threshold by intense elliptically polarized light contain strong asymmetries with respect to reflection about either principal polarization axis. These observations, which contradict Keldysh-Faisal-Geiss theory predictions, point to the significant role of the long range electrostatic potential of the ion in shaping the wave function of the outgoing electron. The experimental evidence for this phenomenon is reviewed for helium, krypton, and xenon photoelectron spectra, as a function of laser intensity, polarization, and electron energy. 15 refs., 10 figs.

46395 Multiphoton ionization with femtosecond laser pulses. Muller, H.G. (Centre Etudes Nucleaire Saclay, Gif-sur-Yvette (France)). pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

There are a number of reasons to use subpicosecond pulses in multiphoton ionization experiments. Pulses with shorter risetimes make it possible to study processes with higher rates before one runs into the problem of depletion of target atoms. Furthermore, the momentum of the electron does not change between the point of ionization and the detector if the pulse expires before the electron has time to sample the spatial inhomogeneity of the light intensity. This makes it possible to identify the intensity at which an electron was formed from the energy with which it reaches the detector. Yet another advantage is the fact that the primary ionization products are subject to the ionizing radiation for only a short amount of time, thus reducing the probability of sequential ionization as compared to direct processes. In this paper the experimental results on the multiphoton ionization of xenon with pulses of 100 fs, that were obtained during the preceding year at ENSTA, Palaiseau, will be presented.

46396 High-order harmonics in light scattering by atomic electrons above threshold. Eberly, J.H. (Univ. of Rochester, NY (USA)); Su, Q.; Javanainen, J. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The authors report on light scattering in multiphoton ionization (MPI) computer experiments at high laser intensity. The plateau and cut-off features recently reported in laboratory experiments on high-order harmonic generation by McPherson, et al., and by Ferray, et al., are corroborated. They report scattered light spectra in four different cases and exhibit the corresponding ATI photoelectron spectra. They propose a connection between ATI and high-order harmonics. 7 refs., 5 figs.

46397 Parabolic mirror electron energy analyzer for multiphoton photoemission spectroscopy. Van Woerkom, L.D. (AT & T Bell Laboratories, Murray Hill, NJ (USA)); Trevor, D.J.; Freeman, R.R. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The authors report the use of a new, extremely efficient electron energy analyzer for recording high resolution electron spectra from multiphoton photoemission. The analyzer used an electrostatic parabolic mirror and has a collection solid angle in excess of 2π sr with an energy resolution of 35 meV at 1.8 eV. They have used this detector to record the above threshold ionization spectra emitted in xenon using a 275 fsec, 616 nm, 2×10^{14} W/cm^2 laser pulse. 5 refs., 4 figs.

46398 Vacuum ultraviolet laser spectroscopy of molecular autoionizing states. Milburn, D. (Univ. of Waterloo, Ontario (Canada)); Hart, D.J.; Hepburn, J.W. pp. 436 of Short wavelength

coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

This paper describes a new apparatus which uses coherent vacuum ultraviolet light to photoionize molecules in a supersonic molecular beam, and energy analyzes the resulting photoelectrons by time of flight spectroscopy. The broadly tunable coherent VUV is generated by four wave sum mixing in Hg. Using this apparatus, the authors have studied the dynamics of autoionization for two different systems: spin-orbit autoionization in HI, and vibrational autoionization in NO. In both cases, our recent results have pointed out dramatic new features of the dynamics in these molecules. 24 refs., 9 figs.

46399 Measurement of the quenching of spontaneous emission coefficients in laser-produced plasmas. Chung, Y. (Princeton Univ., NJ (USA)); Hirose, H.; Suckewer, S. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The quenching of Einstein A-coefficients was observed by measuring the branching ratio of visible and VUV line intensities for CIV, CIII, and NV ions. 16 refs., 11 figs., 1 tab.

46400 Ultra-high resolution VUV-XUV laser: Application to the hyperfine study of krypton. Kung, A.H. (Lawrence Berkeley Lab., CA (USA)); Trickl, T.; Cromwell, E.; Vrakking, M.J.J.; Lee, Y.T. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). DOE Contract AC03-76SF00098. From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

A near-transform-limited VUV-XUV laser source with 210 MHz resolution has been constructed and used to study the hyperfine splitting, isotope shift, and lifetime of the three lowest ns (n=5,6,7) Rydberg states of Krypton. 6 refs., 1 tab.

46401 All short pulse multiphoton ionization is resonant ionization. Cooke, W.; Freeman, R.R.; McIlrath, T.J. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Energy resolved photoelectron spectra of multiphoton ionization taken with a 300 fs laser pulse at 616 nm shows that the ionization probability is highly structured as a function of laser intensity. The spectrum is consistent with all of the ionization occurring at intensity resonances.

46402 (GSI–89-49(prepr.)) **Correlated electron-positron emission in heavy-ion collisions.** Bokemeyer, H.; Folger, H.; Backe, H.; Bethge, K.; Kraft, D.; Sakaguchi, K.; Salabura, P.; Stiebing, K.E.; Cowan, T.; Greenberg, J.S.; EPOS Collaboration. EPOS Collaboration. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.). May 1989. 16p. (CONF-890199–: 8. Moriond workshop on tests of fundamental laws in physics, 21-28 Jan 1989). Order Number DE89915142/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

A group of narrow electron-positron sum-energy lines with similar mean energies around 610, 750 and 810 keV has been observed with the EPOS spectrometer in both collision systems $^{238}U + ^{232}Th$ and $^{238}U + ^{181}Ta$ studied so far at the UNILAC heavy ion accelerator of GSI, Darmstadt. The intensities of the three lines vary with the beam-energy, the variation being most clearly observed for the 748-keV line in $^{238}U + ^{181}Ta$. On the basis of our present understanding Internal Pair Conversion in a collision product at rest or in flight as well as coincident lepton emission during the quasiatomic phase of the collision can be excluded as the origin. The very narrow widths of the sum-energy lines as compared to the widths of the associated broad structure in the difference spectrum of the lepton energies seem to argue for a mutual cancellation of kinematical shifts. Such correlation is expected for two leptons emitted back-to-back in a two-body decay of objects being at rest in the heavy-ion c.m. frame. This speculative hypothesis is confronted with the actual dependence of the lines on the individual lepton energy and the lepton emission angle, as well as on the opening angle of the pair. In fact, the back-to-back decay could not be proved to be a general feature of these lines. (orig.).

46403 (INIS-BR–1584) **Study of internal rotation in molecules using molecular orbital method in the CNDO/BW approximation.** Pedrosa, M.S. Brasilia Univ., DF (Brazil). Dept. de Fisica. Oct 1987. 90p. (In Portuguese). Order Number DE89635737/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

It is presented a LCAO-MO-SCF study of Internal Rotation for the molecules C_2H_6, CH_3NH_2, H_2O_2, and N_2H_4 by ysing the CNDO/BW approximation and an M-center energy partition. Our results are compared with those obtained with the CNDO/2 approximation. It is shown that there are differences in the analysis of the process involved in the internal rotation barriers mechanism. Thus the interpretation of the results is strongly dependent on the parametrization used. (author).

46404 (INIS-BR–1593) **Theoretical studies on CH^+ ion molecule using configuration interaction method and its spectroscopic properties.** Machado, F.B.C. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1985. 146p. (In Portuguese). Order Number DE89635736/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The use of the configuration (CI) method for the calculation of very accurate potential energy curves and dipole moment functions, and then their use in the comprehension of spectroscopic properties of diatomic molecules is presented. The spectroscopic properties of CH^+ and CD^+ such as: vibrational levels, spectroscopic constants, averaged dipole moments for all vibrational levels, radiative transition probabilities for emission and absorption, and radiative lifetimes are verificated. (M.J.C.).

46405 (INIS-BR–1601) **Studies on eletron scattering by hydrogen atoms through of a correlationed wave function.** Jacchieri, S.G. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1982. 83p. (In Portuguese). Order Number DE89635742/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

A correlationed wave function dependent of two adjustable parameters (α e β), aiming describe a system formed by an electron and a hydrogen atom is studied. Some elastic differential cross-sections for several values of α and β parameters, scattering angle of 2^0 to 140^0 and energies of 50 eV and 680 eV are presented. (M.J.C.).

46406 (INIS-BR–1602) **Deuterium NMR, induced and intrinsic cholesteric lyomesophases.** Alcantara, M.R. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1982. 164p. (In Portuguese). Order Number DE89635738/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Induced and intrinsic cholesteric lyotropic mesophases were studied. Induced cholesteric lyomesophases based on potassium laurate (KL) system, with small amounts of cholesterol added, were studied by deuterium NMR and by polarizing microscopy. Order profiles obtained from deuterium NMR of KL perdenderated chains in both induced cholesteric and normal mesophases were compared. The intrinsic cholesteric lyotropic mesophases were based on the amphiphile potassium N-lauroyl serinate (KLNS) in the resolved levo form. The study of the type I intrinsic cholesteric mesophase was made by optical microscopy under polarized light and the type II intrinsic cholesteric lyomesophase was characterized by deuterium NMR. The new texture was explained by the use of the theory of disclinations developed for thermotropic liquid crystals, specially for cholesteric type. (M.J.C.).

46407 (LA-UR–89-2446) **Quantum-mechanical derivation of the Davydov equations for multi-quanta states.** Kerr, W.C.; Lomdahl, P.S. Los Alamos National Lab., NM (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908122–1: NATO workshop on localization of energy in proteins, 1-5 Aug 1989). Order Number

DE89015250/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Our purpose here is to present a derivation of the Davydov equations which employs only quantum-mechanical techniques. The derivation here is more general than our previous treatment of this problem because we use an Ansatz which has present several quanta of the high frequency oscillator system rather than just one quantum. Since some steps of the calculation are the same as those in our paper which treats the single quantum case, reference will be made to that paper for some of the those details. 9 refs.

46408 (LA-UR–89-2453) **Davydov solutions at 300 kelvin: The final search.** Lomdahl, P.S.; Kerr, W.C. Los Alamos National Lab., NM (USA). [1989]. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8908122–2: NATO workshop on localization of energy in proteins, 1-5 Aug 1989). Order Number DE89015248/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The original proposal by Professor A.S. Davydov of a soliton mechanism for localization and transport of energy along linear chain molecules provided the impetus for several research efforts which have explored the properties of these nonlinear entities in differing degrees of realism. The general conclusion from all of this work is that the nonlinear equations of motion which have been used to describe these systems have soliton-like solutions when they are solved in the deterministic limit. This limit corresponds to the absolute zero of temperature, because it ignores the influence of random thermal perturbations on the system. However, the questions of existence and importance of the Davydov soliton remain controversial when non-zero temperature effects are taken into account, because numerical simulations and theoretical calculations done by independent research groups have reached diametrically opposed conclusions. Our 1985 paper was the first to simulate thermal perturbations at biologically relevant temperature (300 K). Since publishing that paper, we have done simulations for collisions of phonon wave packets with Davydov solitons and have also taken into account the presence of multiple quanta of the high frequency oscillator field in the Davydov equations of motion. We present these results here. However, for the major question about the temperature effects on the Davydov soliton, our conclusions remain unchanged. 5 refs., 6 figs., 1 tab.

46409 (LA-UR–89-2724) **The effects of a finite scattering volume on the determination of electron impact coherence parameters.** Zetner, P.W.; Trajmar, S.; Csanak, G. Los Alamos National Lab., NM (USA). 1989. 7p. Sponsored by DOE/MA;NASA;NSF. DOE Contract W-7405-ENG-36. (CONF-890895–2: Polarization and correlation in electronic and atomic collisions, 2-4 Aug 1989). Order Number DE89016588/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

In this paper, we specifically examine the consequences of a finite scattering geometry on "in-plane" coherence experiments, i.e. polarization correlation or superelastic scattering experiments in which the incidence vector of the detected photon or the laser 'photon lies in the nominal scattering plane ($\phi\nu$ = 0). The "in-plane" experimental configuration is adopted in order to give direct information about spin-orbit coupling effects. We show that a finite scattering geometry can give rise to severe distortion in the dependence of the coincidence or superelastic scattering signal intensity on the photon polarization and that this distorted behavior can be misinterpreted as arising from spin-orbit coupling effects. 11 refs., 3 figs.

46410 (LA-UR–89-2798) **Structure and properties of simple molecular systems at very high density.** LeSar, R. Los Alamos National Lab., NM (USA). [1989]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-890798–10: AIRAPT and EHPRG international high pressure science and technology conference, 17-21 Jul 1989). Order Number DE89016974/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The use of computer simulations in the study of molecular systems at very high density is reviewed. Applications to the thermodynamics of dense fluid nitrogen and phase transitions in solid oxygen are presented. The effects of changes in the atomic electronic structure on the equation of state of very dense helium are discussed. 19 refs., 2 figs.

46411 (ORNL/FTR–3064) **[Production of highly charged Ions, Grenoble, France, Uppsala, Sweden, Stockholm, Sweden, Berlin, FRG, Osnabrueck, FRG, Giessen, FRG, Frankfurt, Germany, September 10, 1988–October 2, 1988]: Foreign trip report.** Meyer, F.W. Oak Ridge National Lab., TN (USA). 18 Oct 1988. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017275/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended the International Conference on the Physics and Production of Highly Charged Ions in Grenoble, France, and presented an invited paper on the multicharged ion-surface scattering work done at ORNL. Following this meeting he traveled to Sweden, where he visited Uppsala University to consult on the design and layout of atomic physics beam lines originating from an ECR ion source that will soon be installed there. He also visited the Research Institute of Physics at Stockholm to tour the CRYRING facility. The traveler subsequently visited Hahn-Meitner Institute, Berlin, and Osnabrueck University, Osnabrueck, both in West Germany, to present seminars and to hold discussions on collaborative work in multicharged ion-atom and -surface collision experiments, respectively. Finally, the traveler visited Justus-Liebig University in Giessen, West Germany, to view the ECR source facility there, and to discuss future multicharged ion collision experiments of mutual interest.

46412 (ORNL/FTR–3253) **[Perform quantum chemistry calculations on element 104 using existing computer programs]: Foreign trip report, June 1, 1988–May 10, 1989.** Johnson, E. Oak Ridge National Lab., TN (USA). 26 May 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017293/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Electron ionization energies and parameters for the atomic radii of elements 104 and 105 are discussed. Values for these properties have not been proposed before. The results are expected to provide part of the basis for the calculation of certain chemical properties of elements 104 and 105. Chemical properties of elements 104 and 105 are difficult to determine experimentally because of the short half-lives and low production rates of these elements. A fully numerical method for the solution of the Schrodinger equation of quantum mechanics is discussed. Fully numerical methods are capable of yielding more accurate results than the method that was used to obtain the ionization energies mentioned above. Compared to other fully numerical methods, the method discussed here requires less computation time and it does not have the mathematical singularities that occur in other such methods. Energy research and development projects at the Gesamthochschule Kassel, Federal Republic of Germany are summarized. These projects involve consultation, wind and solar energy production, storage and distribution, hydroelectricity production, the production of biogas, the design of fuel cells, technology transfer, and the political aspects of energy production and distribution. 12 refs.

46413 Search for multiphoton-induced inner-shell excitations. Lee, P. H. Y. (Los Alamos National Laboratory, Mail Stop E-526, Los Alamos, New Mexico 87545(US)); Casperson, D. E.; Schappert, G. T. *Physical Review [Section] A: General Physics (USA)*, 40(3): 1363-1366 (1 Aug 1989). DOE Contract W-7405-ENG-36.

Photon-counting experiments have been conducted to test the conjecture that at sufficiently high laser irradiance, atomic inner-shell excitations can be induced by laser-driven outer-shell oscillations. Using KrF light at an irradiance $\approx 3\times10^{17}$ W/cm^2 on low-density noble-gas targets, we detect no prompt photons which are characteristic of inner-shell processes.

Minnesota Univ., Minneapolis, MN (USA). Dept. of Electrical Engineering. Nov 1988. 109p. Available from NTIS, PC A06/MF A01.

Radio-frequency discharges currently play a major role in the fabrication of microelectronic devices. This manuscript reports on theoretical and experimental studies undertaken in an effort to develop a better understanding of the underlying gas-discharge physics occuring in these discharges. An equivalent circuit model was developed for a planar rf reactor based on the physical properties of the plasma sheath. This model shows that the waveforms of the potentials across the plasma sheaths are highly nonlinear and agree with previously reported measurements. These waveforms were subsequently incorporated into a model for the energy distribution of ions bombarding the electrode surfaces in low pressure rf reactors. Numerical calculations based on this model show the ion bombardment energy distribution is bimodal and skewed toward lower impact energies. Experimental measurements were also performed on the ion-bombardment energy distribution in a planar rf reactor. The results of these measurements agree with the model predictions at low pressure and give information at higher pressures about the effects of collisions on the distribution, which agree with previous studies. The importance of negative ions in a discharge through an electronegative gas was investigated by the development of a collisionless-plasma sheath model for such a discharge. A sheath criterion was derived and used to determine the effects of negative ions on the sheath properties.

46416 (CONF-8908112–2) **An experimental study of helicity and related properties in turbulent flows.** Wallace, J.M.; Balint, J.L. Maryland Univ., College Park, MD (USA). 1989. 13p. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper discusses the measurement of the velocity and vorticity vectors in turbulent flow and the experimental results. 20 refs., 4 figs. (LSP)

46417 (DOE/ER/13902–1) **Thermophysical properties of supercritical fluids and fluid mixtures: Progress report, May 15, 1988–July 31, 1989.** Sengers, J.V. Maryland Univ., College Park, MD (USA). Inst. for Physical Science and Technology. Aug 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER13902. Order Number DE89016568/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The purpose of the research is to extend the theory of critical phenomena in fluids and fluid mixtures to obtain scientifically based equations that include the crossover from the asymptotic singular behavior of the thermophysical properties close to the critical point to the regular behavior of these properties far away from the critical point.

46418 (LA-UR–89-2429) **A parallel numerical simulation for supersonic flows using zonal overlapped grids and local time steps for common and distributed memory multiprocessors.** Patel, N.R.; Sturek, W.B.; Hiromoto, R. Los Alamos National Lab., NM (USA). 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-890941–1: Conference on applications of supercomputers in engineering, 5-7 Sep 1989). Order Number DE89015252/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Parallel Navier-Stokes codes are developed to solve both two- dimensional and three-dimensional flow fields in and around ramjet and nose tip configurations. A multi-zone overlapped grid technique is used to extend an explicit finite-difference method to more complicated geometries. Parallel implementations are developed for execution on both distributed and common-memory multiprocessor architectures. For the steady-state solutions, the use of the local time-step method has the inherent advantage of reducing the communications overhead commonly incurred by parallel implementations. Computational results of the codes are given for a series of test problems. The parallel partitioning of computational zones is also discussed. 5 refs., 18 figs.

46419 (LA-UR–89-2800) **The Riemann problem for a model non-linear elastic continuum.** Hammerberg, J.E. Los Alamos National Lab., NM (USA). [1989]. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890812–27: American Physical Society topical conference on shock compression of condensed matter, 14-17 Aug 1989). Order Number DE89016973/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The solution to the Riemann problem for a non-linear elastic continuum characterized by an internal energy density $e(S, \epsilon_{ij})$, where S is the entropy and ϵ_{ij} the strain tensor, is discussed. Numerical solutions for the wave structure for parameters appropriate to Tungsten are discussed. 4 refs.

46420 (LNCC–035/88) **Existence of Bose-Einstein condensation in one and two dimensions.** Olinto, A.C. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). Oct 1988. 14p. Order Number DE89635910/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

It is shown that in Bose Condensed systems the γ-sum rule has an additional term due to the condensate reservoir. As a result of this new sum rule and an exact Bogoliubov inequality, Bose-Einstein condensation in repulsively interacting systems may occur in one and two dimensions. (author).

46421 (N–89-22709) **High accuracy thermal conductivity measurements near the lambda transition of helium with very high temperature resolution. Final report.** Fairbank, W.M.; Lipa, J.A. Stanford Univ., CA (USA). Mar 1989. 26p. (NASA-CR–184836;NAS–1.26:184836). Available from NTIS, PC A03/MF A01.

Over the past few years extensive thermal conductivity measurements near the lambda point of helium were made. The original goal of measuring the thermal conductivity with a resolution of t = T/T sub lambda -1 of 3 x 10(-8) was reached, but with somewhat less accuracy than was hoped. Subtle effects in the apparatus near the transition were observed which reduced the ability to interpret the results. Nevertheless, for resolution of t is greater than or equal to 10(-7) reliable data was obtained, extending previous measurements by more than an order of magnitude. Deviations from theoretical predictions were observed for t is less than or equal to 3 x 10(-6) leading to the question of the validity of the present renormalization group analysis of transport properties, at least for the case of helium. This anomaly led to closer examination of the boundary effects in the measurements. During the experiments a totally unexpected effect in the very dilute He-3 - He-4 mixtures was observed which led to the explanation of the anomalous results. The concentration dependence of the thermal conductivity near T sub lambda in the superfluid phase was found to deviate strongly from the predictions. The results gave an independent verification of this behavior and caused reanalysis of the Khalatnikov theory of hydrodynamics of the mixtures. An alternative solution was found which is in better agreement with the experiment.

46422 (UCRL–101562) **Cellular automata and massively pararllel physics.** Leith, C.E. Lawrence Livermore National Lab., CA (USA). Mar 1989. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8903159–1: Whither turbulence conference, 22-24 Mar 1989). Order Number DE89016506/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper discuss using cellular automata and parallel processing for computer simulation of fluid dynamics. 12 refs. (LSP)

46423 A comparison between integral equation theory and molecular dynamics simulations of dense, flexible polymer liquids. Curro, J. G. (Sandia National Laboratories, Albuquerque, New Mexico(US)); Schweizer, K. S.; Grest, G. S.; Kremer, K. *Journal of Chemical Physics (USA)*, 91(2): 1357-1364 (15 Jul 1989). DOE Contract AC04-76DP00789.

Recently we (J.G.C. and K.S.S.) formulated a tractable "reference interaction site model" (RISM) integral equation theory of flexible polymer liquids. The purpose of this paper is to compare the results of the theory with recent molecular dynamics simulations (G.S.G. and K.K.) on dense chain liquids of degree of polymerization N=50 and 200. Specific comparisons were made between theory and simulation for the intramolecular structure factor $\hat{\omega}(k)$ and the intermolecular radial distribution function $g(r)$ in the liquid. In particular it was possible to independently test the assumptions inherent in the RISM theory and the additional ideality approximation that was made in the initial application of the theory. This comparison was accomplished by calculating the intermolecular $g(r)$ using the simulated intramolecular structure factor, as well as, $\hat{\omega}(k)$ derived from a freely jointed chain model.The RISM theory results, using the simulated $\hat{\omega}(k)$, were found to be in excellent agreement, over all length scales, with the $g(r)$ from molecular dynamics simulations. The theoretical predictions using the "ideal" intramolecular structure factor tended to underestimate $g(r)$ near contact, indicating local intramolecular expansion of the chains. This local expansion can be incorporated into the theory self consistently by including the effects of the "medium induced" potential on the intramolecular structure.

46424 Velocity persistence of Brownian particles generated in a glow discharge. Hurd, A. J. (Sandia National Laboratories, Albuquerque, New Mexico 87185(US)); Ho, P. *Physical Review Letters (USA)*, 62(26): 3034-3037 (26 Jun 1989). DOE Contract AC04-76DP00789.

Quasielastic light scattering from Brownian particles in the rarefied environment of a glow discharge exhibits Gaussianlike intensity correlation functions owing to the long mean free paths of the particles. The shape of the correlation function depends on the particles' average thermal velocity and friction coefficient, which can be related to aggregate mass and structure, and indicates a crossover from kinetic to hydrodynamic behavior.

46425 (AECL–9351) **Progress report - Physics and Health Sciences - Physics Section - 1986 July 01 - December 31.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Feb 1987. 126p. (PR-PHS-P–2). Order Number DE89634565/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

This progress report of the Physics section of Chalk River Nuclear Laboratories highlights work on major equipment: (1) Tandem Accelerator Superconducting Cyclotron (TASCC), (2) Isotope Separator On Line (ISOL), (3) Spectrometer Array for Particles Produced in Heavy Ion Reactions (SAPPHIRE), and (4) The Double Neutron Spectrometer for neutron scattering (DUALSPEC). Theoretical physics work includes fractal theory, non-topological soliton model of the nucleons, meson currents in relativistic shell model theories and supergravity. Progress of the Sudbury Neutrino Observatory (SNO) and the National Fusion Program (NFP) is discussed. Two commercial aspects are included; the formation of Shar-Buc Enterprises, the first spin-off business of the Research Company and the Applied Neutron Diffraction for Industry (ANDI), a major commercial activity.

46426 (CONF-8905143–12) **The non-perturbative quark-gluon plasma.** Polonyi, J. Massachusetts Inst. of Tech., Cambridge, MA (USA). Center for Theoretical Physics. Jul 1989. 11p. Sponsored by DOE/ER;NSF. DOE Contract AC02-76ER03069. (CTP–1765). From NATO advanced study institute international advanced course on the nuclear equation of state; 12 May - 3 jun 1989. Order Number DE89016583/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

After a brief and subjective evaluation of some talks of this School dealing with the high temperature phase of QCD a mechanism for quark confinement is presented. 18 refs., 5 figs.

46427 (INIS-mf–11514) **Proceedings of the 8 Warsaw symposium on elementary particle physics, Kazimierz, Poland, May 26 - June 1, 1985.** Ajduk, Z. (ed.). Warsaw Univ. (Poland). Inst. Fizyki Doswiadczalnej; Warsaw Univ. (Poland). Inst. Fizyki Teoretycznej. 1985. 692p. (CONF-8505238–: 8. Warsaw symposium on elementary particle physics, 1 May 1985). Order Number DE89635911/JAW. Available from NTIS (US Sales Only), PC A99/MF A01 - OSTI; INIS.

These proceedings contain 47 lectures held at the symposium. They deal with pbar-p collider results, phenomenology of electroweak effects, high energy lepton interactions, high energy hadron interactions, quantum chromodynamics, bag model, grand unification, supersymmetry and superstring theory. (M.F.W.).

46428 Search for scalar mesons. Pennington, M.R. (Brookhaven National Lab., Upton, NY (USA)). pp. 729 of Glueballs, hybrids, and exotic hadrons. Chung, Suh-Urk (ed.) American Institute of Physics, New York, NY (1989). From BNL workshop on glueballs, hybrids and exotic hadrons; 29 Aug - 1 sep 1988.

The search for I = 0 0^{++} mesons is described. The crucial role played by the states in the 1 GeV region is highlighted. An analysis program that with unimpeachable data would produce definitive results on these is outlined and shown with present data to provide prima facie evidence for dynamics beyond that of the quark model. The authors briefly speculate on the current status of the lowest mass scalar mesons and discuss how experiment can resolve the unanswered issues. 30 references, 6 figures, 1 table.

46429 High intensity hadron facility, AGS II. Lee, Y.Y. (Brookhaven National Lab., Upton, NY (USA)); Lowenstein, D.I. pp. 729 of Glueballs, hybrids, and exotic hadrons. Chung, Suh-Urk (ed.) American Institute of Physics, New York, NY (1989). From BNL workshop on glueballs, hybrids and exotic hadrons; 29 Aug - 1 sep 1988.

There is a large and growing community of particle and nuclear physicists around the world who are actively lobbying for the construction of an accelerator that could provide 1-2 orders of magnitude increase in proton intensity above that of the present AGS. There have been a series of proposals from Canada, Europe, Japan, and the USA. They can all be characterized as machines varying in energy from 12-60 GeV and intensities of 30-100 μA. The community of physicists using the AGS are in a unique position however. The AGS is the only machine available that can provide the beams to execute the physics program that this large international community is interested in. The BNL approach to the communities interests involves a stepwise intensity upgrade program. At present the AGS slow extracted beam current is 1 μA. With the completion of the Booster in 1990 and the associated AGS modifications, the current will rise to 4-5 μA. With the subsequent addition of the Stretcher which is under design, the current will rise to 8-10 μA and approximately 100% duty factor. The possibility of a further enhancement to a current level of 40-50 μA CW is now being examined. 2 figures, 6 tables.

46430 Measuring b → c searching for b → u. Shipsey, I.P.J. (Syracuse Univ., NY (USA)). pp. 729 of Glueballs, hybrids, and exotic hadrons. Chung, Suh-Urk (ed.) American Institute of Physics, New York, NY (1989). From BNL workshop on glueballs, hybrids and exotic hadrons; 29 Aug - 1 sep 1988.

Progress towards the measurement of V_{cb} is reviewed. The search for b → u is discussed. Searches for the charmless modes B → $p\bar{p}\pi(\pi)$ are described in detail. 25 references, 9 figures, 6 tables.

46431 Exotic mesons in $\bar{N}N$ annihilation. Dover, C.B. (Brookhaven National Lab., Upton, NY (USA)). pp. 729 of Glueballs, hybrids, and exotic hadrons. Chung, Suh-Urk (ed.) American Institute of Physics, New York, NY (1989). DOE Contract AC02-76CH00016. From BNL workshop on glueballs, hybrids and exotic hadrons; 29 Aug - 1 sep 1988.

The author investigates the utility of the antinucleon-nucleon ($\bar{N}N$) annihilation process as a means of producing exotic (non $\bar{Q}Q$) mesons. Several examples are considered of J^{PC} exotic formation in the $\bar{p}p \rightarrow \pi X$ reaction. He emphasizes the usefulness of quantum number filtration, achieved by preparing the initial $\bar{p}p$ atom in tagged L = 0,1 states and focusing on selected exclusive final states. 36 references, 4 tables.

46432 CESR single IR upgrade. Rubin, D.L. (Cornell Univ., Ithaca, NY (USA)). pp. 729 of Glueballs, hybrids, and exotic hadrons. Chung, Suh-Urk (ed.) American Institute of Physics, New York, NY (1989). From BNL workshop on glueballs, hybrids and exotic hadrons; 29 Aug - 1 sep 1988.

The Cornell Electron Storage Ring operates with seven bunches per beam and 11 ma per bunch to yield a peak luminosity of 1 x 10^{32} cm^{-2} s^{-1} in each of two interaction areas on the Y (5s) resonance. The corresponding daily integrated luminosity is 4.7 pb^{-1}. An electrostatic orbit distortion separates the beams at the 12 parasitic crossings. The beam-beam limit can be upgraded by the elimination of one of the two interaction regions, doubling of the number of bunches per beam from 7 to 14, and enhancing the beam width at the interaction point. Currents of about 300ma/beam will be required to operate the reconfigured machine at its beam-beam limit. The scheme of upgrades is expected to yield a factor of five increase in CESR luminosity to more than 5 x $10^{32}cm^{-2}$ s^{-1}. 14 references, 2 figures, 1 table.

46433 BNL glueball review. Toki, W.H. (Stanford Univ., CA (USA)). pp. 729 of Glueballs, hybrids, and exotic hadrons. Chung, Suh-Urk (ed.) American Institute of Physics, New York, NY (1989). DOE Contract AC03-76SF00515;AC02-76ER01195;AC03-81ER40050. From BNL workshop on glueballs, hybrids and exotic hadrons; 29 Aug - 1 sep 1988.

The glueball session of the BNL workshop on glueballs, hybrids and exotic hadrons is reviewed. This includes studies of $K\bar{K}\pi$, $\eta\pi\pi$, $\gamma\rho^0$, $\pi\pi$, $K\bar{K}$, $\eta\eta$, $\phi\phi$, $\rho\rho$, $\omega\omega$, and $K^*\bar{K}^*$ resonances produced in $\gamma\gamma$, J/ψ, K^-p and π^-p reactions. 44 references, 5 figures, 4 tables.

46434 Stimulated Compton backscattering and the high intensity Kapitza-Dirac effect. Schumacher, D.W. (AT & T Bell Laboratories, Murray Hill, NJ (USA)); Bucksbaum, P.H.; Bashkansky, M. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The authors report the scattering of low energy free electrons from an optical standing wave at intensities of 10^{13} to $10^{14}W/cm^2$. This interaction is the high intensity limit of the Kapitza-Dirac effect, wherein electrons Bragg scatter from the standing wave lattice. In this regime, the momentum exchanged exceeds the reciprocal lattice vector by a factor of 500 or more, and the scattering rate is comparable to the optical frequency. The electron motion is most easily analyzed by classical mechanics. 11 refs., 9 figs.

46435 (FNAL/C–89/148-E) **A missing transverse energy analysis of 1.8 TeV $\bar{p}$-p collisions observed at CDF.** The CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (USA). Jun 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-8902122–3: Results and perspectives in particle physics, 26 Feb - 4 mar 1989). Order Number DE89016732/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We summarize a missing transverse energy analysis of 25.3 nb^{-1} of $\bar{p}$-p collision data taken with the CDF detector during its 1987 run. With this analysis we excluded supersymmetric squarks of mass less than 73 GeV, and supersymmetric gluinos of mass less than 74 GeV at the 90% CL. We then present a preliminary missing transverse energy analysis of 1 pb^{-1} of proton-antiproton collision data at c.m. energy of 1.8 TeV observed by the CDF detector during the 1988–1989 Tevatron Collider run. The distribution of events with large missing transverse energy is again found to be consistent with Standard Model expectations. The absence of an excess of events with large missing transverse energy in this preliminary analysis suggests that in the simplest supersymmetry scenario, the existence of supersymmetric squarks of mass less than 150 GeV is unlikely. 6 refs., 6 figs., 3 tabs.

46436 (KEK–88-10, pp. 350-365) **Standard Higgs search at future hadron colliders.** Kondo, T. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The present note gives a brief review on the possibility of the Higgs particle search at future hadron colliders, SSC and/or LHC. The aim of the review is to introduce current information on Higgs search at future hadron colliders with an emphasis on experimental aspects. Some preliminary work by Monte Carlo simulations is also outlined. A brief and incomplete collection of the detection feasibility studies on the intermediate and heavy mass Higgs boson at future badron collider is presented. The summary is limited to the standard neutral Higgs boson. At future hadron colliders with integrated luminosity of $10^{40}cm^{-2}$, it is shown that the detection is feasible in the mass range of 200-500GeV/c^2 through the 4-lepton decay mode (H->ZZ->1111). For the Higgs mass of above 500GeV/c^2, the 2-lepton 2-neutrino decay mode (H->ZZ->11$\nu\nu$) is quite promising with a detector having good hermeticity. It is expected that the quark-jet tagging would reduce the QCD backgrounds substantially. The detection feasibility of the intermediate-mass Higgs boson depends on the top mass. However, by combining various decay modes, H->$\gamma\gamma$, Zγ, ZZ*, tau$^+$tau$^-$ and (b b-bar), it seems to be possible to cover the mass range of 100-200 Gev/c^2. (Nogami, K.).

46437 (LA-UR–89-2756) **Eta meson production in pion-induced reactions.** Peng, J.C. Los Alamos National Lab., NM (USA). 1988. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8811171–4: 17. INS international symposium on nuclear physics at intermediate energies, 15-17 Nov 1988). Order Number DE89016586/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Recent experiments at LAMPF to study pion-induced eta meson production are discussed. Results from the $\pi^-p \rightarrow \eta n$ and π^- $^3He \rightarrow \eta t$ reactions, potentially useful for tagged η production, are presented. Preliminary results from the $\pi^{\pm}d \rightarrow \eta NN$ reaction, as well as mass and energy dependence of inclusive (π,η) cross sections on heavy nuclei are shown. Information on η-nucleus interaction is extract from these data. 31 refs., 11 figs.

46438 (LA-UR–89-2960) **Hadron distributions at CERN–Heavy Ion experiments.** Jacak, B. HELIOS Collaboration. Los Alamos National Lab., NM (USA). 1989. 11p. Sponsored by U.S. DOE Energy Research. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper discusses the following topics: charged particle pseudorapidity distribution; pion transverse momentum distributions; and kaon production. 24 refs., 8 figs.

46439 (SLAC-PUB–4997) **An experimental review of the decays of the D_S meson.** Schindler, R.H. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jun 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8904226–7: 12. international workshop on weak interactions and neutrinos, 9-14 Apr 1989). Order Number DE89016688/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

In this paper I review the current experimental knowledge of the decays of the D_s meson. I compare D_s properties to those predicted from recent comprehensive D meson decay models that are based on the better measured charmed isodoublet (D^0,D^+). 12 refs., 5 figs., 2 tabs.

46440 (SLAC-PUB–5004) **Multiple-neutral-meson decays of the τ lepton and electromagnetic calorimeter requirements at Tau-Charm Factory.** Gan, K.K. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 13p. Sponsored by U.S. DOE

Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–9: Tau-Charm workshop, 23-27 May 1989). Order Number DE89016689/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This is a study of the physics sensitivity to the multiple-neutral-meson decays of the τ lepton at the Tau-Charm Factory. The sensitivity is compared for a moderate and an ultimate electromagnetic calorimeter. With the high luminosity of the Tau- Charm Factory, a very large sample of the decays $\tau^- \rightarrow \pi^- 2\pi^0 \nu_\tau$ and $\tau^- \rightarrow \pi^- 3\pi^0 \nu_\tau$ can be collected with both detectors. However, with the ultimate detector, $2\pi^0$ and $3\pi^0$ can be unambiguously reconstructed with very little background. For the suppressed decay $\tau^- \rightarrow \pi^- \eta\pi^0 \nu_\tau$, only the ultimate detector has the sensitivity. The ultimate detector is also sensitive to the more suppressed decay $\tau^- \rightarrow K^- \eta \nu_\tau$ and the moderate detector may have the sensitivity if the hadronic background is not significantly larger than that predicted by Lund. In the case of the highly suppressed second-class-current decay $\tau^- \rightarrow \pi^- \eta \nu_\tau$, only the ultimate detector has sensitivity. The sensitivity can be greatly enhanced with a small-angle photon veto. 16 refs., 9 figs., 2 tabs.

46441 (SLAC-PUB–5005) **Physics with low-energy e^+e^- and e^-e^- collisions at Tau-Charm Factory.** Gan, K.K. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–8: Tau-Charm workshop, 23-27 May 1989). Order Number DE89016690/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The physics opportunities in e^+e^- collisions with $\sqrt{s} \simeq$ 1-2 GeV and e^-e^- collisions with $\sqrt{s}$ ~5 GeV at Tau-Charm Factory are being explored. The low-energy e^+e^- option allows precise measurements of e^+e^- cross sections into π's and η's and hence stringent tests of the conserved-vector-current (CVC) hypothesis in τ decays. Precise measurement of the total hadronic cross section also permits a more precise calculation of the muon anomalous magnetic moment (g-2). The e^-e^- option provides an opportunity for a sensitive search for lepton-number violating processes $e^-e^- \rightarrow \mu^-\mu^-$, $\tau^-\tau^-$, $\mu^-\tau^-$ .... The e^-e^- collider also provides an ideal laboratory for two-photon physics with no one-photon background and the direct measurement of the two-photon background in one-photon physics! 19 refs., 4 figs.

46442 (SLAC-PUB–5046) **Monte Carlo study of CP asymmetry measurement of a Tau-Charm Factory.** Karshon, U. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–5: Tau-Charm workshop, 23-27 May 1989). Order Number DE89015636/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

It is shown that, for $D^0\bar{D}^0$ mixing of order ~ 1%, it may be possible to observe in a Tau-Charm Factory a CP violation effect in the $D^0\bar{D}^0$ system via a CP asymmetry. The method used is to tag one D by its semi-leptonic decay and to look for decays of the other D into CP eigenstates. It is estimated that within 1 year of running at the designed luminosity of $L = 10^{33}$ cm^{-2}sec^{-1}, ~ 6600 such events can be collected. 8 refs., 8 figs., 1 tab.

46443 (SLAC-PUB–5081) **Strangeonium spectroscopy at the J/ψ: A comparison with kaon hadroproduction.** Ratcliff, B.N. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 27p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–12: Tau-Charm workshop, 23-27 May 1989). Order Number DE89016950/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

An experimental program to study strangeonium mesons produced in the decays of the J/ψ at a τ-charm factory is compared with experiments on similar final states in kaon hadroproduction. The sample sizes and experimental performance required are discussed. The complementarity of different production modes and the importance of a broad programmatic approach to this physics are stressed. 21 refs., 15 figs., 1 tab.

46444 (UCLA–10-P25-112) **[Medium energy particle physics]: Annual progress report.** Nefkens, B.M.K. California Univ., Los Angeles, CA (USA). Oct 1985. 269p. Sponsored by U.S. DOE Energy Research. DOE Contract AS03-81ER40021. Order Number DE89016006/JAW. Available from NTIS, PC A12/MF A01 - OSTI.

Investigations currently carried out by the UCLA Particle Physics Research Group can be arranged into four programs: Pion-Nucleon Scattering; Tests of Charge Symmetry and Isospin Invariance; Light Nuclei (Strong Form Factors of ^{3}H, ^{3}He, ^{4}He; Detailed Balance in pd $\rightleftarrows \gamma^3$H; Interaction Dynamics); and Search for the Rare Decay $M^+ \rightarrow e^+ + \gamma$ (MEGA). The general considerations which led to the choice of physics problems investigated by our group are given in the next section. We also outline the scope of the research being done which includes over a dozen experiments. The main body of this report details the research carried out in the past year, the status of various experiments, and new projects.

46445 (BNL–42957) **Neutrino physics: Summary talk.** Marciano, W.J. Brookhaven National Lab., Upton, NY (USA). Apr 1989. 40p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8809223–8: Workshop on new directions in neutrino physics, 14-16 Sep 1988). Order Number DE89016409/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper is organized as follows: First, I describe the state of neutrino phenomenology. Emphasis is placed on $\sin^2\theta_W$, its present status and future prospects. In addition, some signatures of "new physics" are described. Then, kaon physics at Fermilab is briefly discussed. I concentrate on the interesting rare decay $K_L \rightarrow \pi^0 e^+ e^-$ which may be a clean probe direct CP violation. Neutrino mass, mixing, and electromagnetic moments are surveyed. There, I describe the present state and future direction of accelerator based experiments. Finally, I conclude with an outlook on the future. Throughout this summary, I have drawn from and incorporated ideas discussed by other speakers at this workshop. However, I have tried to combine their ideas with my own perspective on neutrino physics and where it is headed. 49 refs., 3 figs., 4 tabs.

46446 (BONN-IR–88-38) **Simulation calculations on the measurement of electroweak processes in the ZEUS experiment.** Gry, O. Bonn Univ. (Germany, F.R.). Physikalisches Inst.; Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet. Jul 1988. 62p. (In German). Order Number DE89915157/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

The present thesis deals with the determination of the kinematical variables Q^2, x, and y for the study of electroweak processes in the ZEUS experiment. The focus lies thereby on high Q^2 range which will be reached experimentally for the first time at HERA (Q^2>1000 GeV^2). Beyond it is studied how precisely two parameters of the electroweak theory, $\sin^2\theta_w$ and the rho parameter, can be determined because of statistical and experimental errors. For NC events the kinematical variables can be determined over a wide kinematical range both via the electron and via the produced hadrons. Corresponding to these two possibilities both the properties of the electromagnetic calorimeter and the hadronic calorimeter are regarded. On the hadronic side furthermore a study of the influence of the beam-pipe section and the error correlated to this in the application of the Jacquet-Blondel formalism is performed. By this the introduction and determination of a correction matrix A results which in spite of systematical shift of the events to smaller values of x and Q^2 allows to determine from just these $\sin^2\theta_w$ with an error only unessentially larger against the ideal case without beam-pipe section. Finally as result of the studies some fit results concerning the errors of $\sin^2\theta_w$ and the rho parameter both on the electron and on the hadron side are presented. (orig.).

46447 **QCD tests of: G(1.6) = glueball.** Narison, S. (U.S.T.L., Montpellier (France)). pp. 729 of Glueballs, hybrids, and exotic hadrons. Chung, Suh-Urk (ed.) American Institute of Physics, New York, NY (1989). From BNL workshop on glueballs, hybrids and exotic hadrons; 29 Aug - 1 sep 1988.

The evidence within QCD (spectral sum rules, low energy theorems and current algebra for the pseudoscalar nonet) that the

G(1.6) meson seen at GAMS is a relatively pure gluonion state is presented. The suppression of the G(1.6) coupling to Goldstone boson pairs being consistent with the existence of a low mass $\sigma(0.9)$ state which saturates the (P —θ—$^{\mu}_{\mu}$ P) vertex (P ≡ π,K). The author presents a crude estimate of the G, fsub 0 (1.3) and σ two photon widths and of their production in ψ and Y radiative decays. 7 references.

46448 Inevitable dibaryons. Maltman, K. (Los Alamos National Lab., NM (USA)); Goldman, T.; Stephenson, G.J. Jr.; Schmidt, K.E.; Wang, F. pp. 729 of Glueballs, hybrids, and exotic hadrons. Chung, Suh-Urk (ed.) American Institute of Physics, New York, NY (1989). From BNL workshop on glueballs, hybrids and exotic hadrons; 29 Aug - 1 sep 1988.

Certain qualitative features common to all phenomenological models of hadron structure based on the idea of a separation of perturbative and confinement regimes in QCD necessarily lead to the prediction that, independent of more detailed dynamics, well-defined positive parity channels must support dibaryon resonances. These channels are identified and the qualitative physics underlying this claim discussed. Of these states, only one, with quantum numbers IJ^P-03$^+$, is non-strange. Cross-section estimates are presented for its production in $\pi d \rightarrow \pi X$ and $np \rightarrow X$. 11 references, 1 table.

46449 (DOE/ER/03075–T2) **CY90 budget submission for theoretical research on elementary particles and interactions.** Appelquist, T. Yale Univ., New Haven, CT (USA). Dept. of Physics. Jun 1989. 47p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76ER03075. Order Number DE89016497/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper discusses budgetary information on theoretical research of elementary particles at Yale University. Individual research is discussed briefly. (LSP)

46450 (DOE/ER/13065–587) **A comparison of quark and gluon jets produced in 3-jet e^+e^- annihilation events.** Bodek, A. The AMY Collaboration. Rochester Univ., NY (USA). Dept. of Physics and Astronomy. 8 Aug 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76ER13065. (CONF-8906199–1: 9. international conference on physics in collision, 19-21 Jun 1989). Order Number DE89016336/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Three-jet events produced in e^+e^- annihilations are used to provide comparisons between quark and gluon jets. Differences between quark-induced and gluon-induced jets are observed. Quark jets tend to have a more tightly collimated structure than gluon jets, which is reflected in the concentration of a larger fraction of the jet's energy near the jet axis. These properties can be used to enhance signals for new particles produced in e^+e^- and hadron colliders, and discriminate against QCD backgrounds from gluon jets. 11 refs., 4 figs.

46451 (DOE/ER/40423–05-P9) **Sea quarks and the hadron spectrum.** Patel, A.; Gupta, R.; Kilcup, G.W.; Sharpe, S.R. Washington Univ., Seattle, WA (USA). Dept. of Physics. Apr 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AS06-88ER40423. (CERN-TH–5379/89). Order Number DE89017323/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We present lattice Monte Carlo results demonstrating the effects of dynamical quarks on the hadron spectrum. We show that the sea quarks do not influence the nucleon and the rho in an identical manner, and the ratio M_N/M_ρ decreases as the sea quark mass is decreased. We also find a large value for the sea quark contribution to the matrix element $\langle N|\bar{u}u - \bar{d}d|N\rangle$. 16 refs., 2 figs., 3 tabs.

46452 (FNAL/C–89/168-T) **The theory of heavy flavour production.** Ellis, R.K. Fermi National Accelerator Lab., Batavia, IL (USA). 9 Aug 1989. 36p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-8907134–1: 17. SLAC summer institute: physics at the 100 GeV mass scale, 10-21 Jul 1989). Order Number DE89016734/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The theory of heavy quark production in hadronic reactions is reviewed. Rates for the production of charm, bottom and top quarks at energies of current interest are presented. 34 refs., 19 figs., 2 tabs.

46453 (IC–89/20) **On the possibility of studying extra gauge Z'-boson effects in e^+e^- -> l^+l^- at TRISTAN.** Pankov, A.A.; Satsunkevich, I.S. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 16p. Order Number DE89635921/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A new possibility is suggested in order to study in the process e^+e^- -> l^+l^- at energies below the standard Z-boson production threshold the effects coming from an extra neutral gauge boson Z' in superstring-inspired E_6 models. It is shown that at energies $\sqrt{s} \sim$ 50 - 60 GeV the cross-section for relatively light Z'($M_{Z'} <$ or approx. $2.5M_Z$) can have an interference dip absent in the standard model. The depth and energy coordinates of this dip depend on Z'-boson parameters. This information concerning the Z'-boson can be obtained by making use of TRISTAN, which is a high-luminosity set-up. (author). 8 refs, 7 figs.

46454 (IC–89/43) **Can we treat the confinement as a pure relativistic effect?.** Kagramanov, E.D.; Nagiyev, Sh.M.; Mir-Kasimov, R.M. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 7p. Order Number DE89635929/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The attempt was made to explain the confinement property of strong interactions from geometrical point of view based on the covariant finite-difference Schroedinger equation in the relativistic configurational r-vector space. It is shown that the solution of this equation for the quark-antiquark system exist, which contains a universal damping factor. (author). 9 refs.

46455 (INIS-BR–1573) **Center-of-mass corrections in the S+V potential model.** Palladino, B.E. Instituto de Fisica Teorica, Sao Paulo, SP (Brazil). Feb 1987. 90p. (In Portuguese). Order Number DE89635940/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

Center-of-mass corrections to the mass spectrum and static properties of low-lying S-wave baryons and mesons are discussed in the context of a relativistic, independent quark model, based on a Dirac equation, with equally mixed scalar (S) and vector (V) confining potential. (author).

46456 (INIS-SU–96, pp. 49-51) **Analysis of polarization observables in electrodisintegration of tensorly polarized deuterons α-vector (e,pn)e'.** Rekalo, M.P. (AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst.); Gakh, G.I.; Rekalo, A.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1987. (In Russian). In *General and nuclear physics. Scientific-technical collection of papers.* Order Number DE89012202/JAW. Available from NTIS (US Sales Only), PC A07/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).

Within the framework of relativistic impulse approximation polarization effects in the d-vector(e,pn)e' reaction on a target with tensor polarization are analyzed. The most interesting asymmetries in the case kinematically equivalent to disintegration of tensorly polarized deuteron are calculated. 6 refs.; 3 figs.

46457 (KEK–88-10, pp. 8-15) **Large enhancement of the production of ultraheavy quark bound states via Higgs-boson exchange in multi-TeV collider energies.** Inazawa, H. (Shoin Women's Univ., Kobe (Japan)); Morii, T. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The production of bound states composed of the ultraheavy quark via Higgs-boson exchange is hugely enhanced in multi-TeV collider energies. In the two-Higgs-doublet model the wave function at the origin of such a bound state is enhanced further by the ratio of two vacuum expectation values v_D/v_U. (author).

46458 (KEK–88-10, pp. 23-27) **Classical solutions in the electroweak theory.** Fujii, Kazuyuki (Kyushu Univ., Fukuoka (Japan). Faculty of Science); Otsuki, Shoichiro; Toyoda, Fumihiko. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan).

Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

Relations among some classical solutions of the SU(2) gauge-Higgs system are investigated. They include the 'spherically' symmetric sphaleron as a saddle point solution and Nambu's string-monopole configuration which is 'axially' symmetric. They are transformed to each other by a singular gauge transformation or Hopf projection at r->∞. Although their configurations are not topological ones, the noncontractible loops and spheres are calucurated by extending the Hopf projection. (author).

46459 (KEK–88-10, pp. 35-46) **CP-violation in SUSY.** Kizukuri, Yoshiki (Tokai Univ., Hiratsuka, Kanagawa (Japan). Dept. of Physics). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

CP-violation sources inherent in supersymmetric models and their phenomenological aspect are reviewed. The models discussed in this review are asuumed to be derived from N = 1 supergravity theories at the Planck mass scale, and have an SU(3) x SU(2) x U(1) symmetry at the low energies. (author).

46460 (KEK–88-10, pp. 99-121) **Leptonic gluon in the unified subquark model.** Akama, Keiichi (Saitama Medical Coll., Moroyama (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The leptonic gluon, i.e. the composite vector boson made of the subquark carrying the leptonic color and its anti-particle, would render important evidences for the subquark model. A unified subquark model including it is constructed, and its properties are investigated. (author).

46461 (KEK–88-10, pp. 1-7) **Testing the standard electroweak theory through the measurement of $\sigma_{tot}(e^+e^- \rightarrow W^+W^-)$.** Hioki, Zenro (Tokushima, Univ. (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The standard SU(2) x U(1) gauge theory of the electroweak interaction has been so far intensively studied in an energy region up to 100GeV. It is consequently known that only this theory, called the electroweak theory, can describe various processes successfully. In connection with the W pair production in LEP II, the present report addresses the M_w determination from $\sigma_{tot}(e^+e^- \rightarrow W^+W^-)$ since this subject includes some misleading and confusing problems. Precise determination of M_w and M_z are very important for testing the electroweak higher order effects clearly. For W mass determination, it is found that the region $\sqrt{S} \leq 2M_w + 10GeV$ is obviously inadequate while threshold behavior of σ_{tot} is quite universal and therefore this region is suitable. Further calculations are made based on observations. Treating the ZWW coupling constant g_{zww} as a free parameter and taking account of actual experimental error of g_{cc}, g_{NC} and $\sin^2\theta_W$, etc., examination is made on how precisely M_w can be determined in the threshold region. As a result, it is found that $\Delta M_w \leq$ 0.2-0.3GeV although it is rather a rough estimate. Anyway, it may be expected that the kinematical mass of W can be determined from $\sigma_{tot}(e^+e^- \rightarrow W^+W^-)$ only in the threshold region. (Nogami, K.).

46462 (KEK–88-10, pp. 16-22) **Sphaleron creation in collisions?.** Aoyama, Hideaki (Kyoto Univ. (Japan). Dept. of Physics). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The report reviews analyses of the sphaleron creation rate in high energy collisions. Sphaleron is a finite energy static solution in the standard SU(2) X U(1) electroweak theory. It is in the vaccum sector, i.e., is topologically trivial. It is unstable, and has mass of the order of M_w/α_{wk}, ~ 10 Tev. Since it can 'mediate' Δ(B+L)not =0 processes, it may have important effects in experiments in the TeV scale. To examine the qq-bar->Sphaleron process, sphaleron is assumed to be a coherent state of free field operators. Then, the rate for the desired process can be written as a convolution of the qq-bar->nW amplitude and the overlap integral between the nW state and sphaleron state. In this particular gauge, the sphaleron solution is singular at origin, which leads to some (gauge-dependent) divergences. Since this is purely a gauge artifact, this problem is avoided by defining the sphaleron as a coherent state of gauge-invariant field operators of specific forms. This effectively provides a gauge-invariant cutoff of the orign. It is found that for $\lambda \sim g^2$, the expected number N_{wz} of the W's and Z's are ~55, with an energy of 11 TeV. Since $M_{sp} \sim$10Tev, the sphaleron can be regarded as a loosely bound system of W's and Z's in this range of the coupling constants. Furthermore, momentum spread of these W's and Z's are of $O(M_w)$, rather small compared to M_{sp}. After some calculations, the desired amplitude is obtained in an approximate form. (N.K.).

46463 (KEK–88-10, pp. 131-151) **New physics at TeV scale.** Terazawa, Hidezumi (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

Many important predictions mostly in composite models which have already been checked or will be tested in the future experiments at TeV energy scale are summarized. They include predictions for (1) the gauge coupling constants (and the weak mixing angle), (2) the masses of the Higgs scalar and top quark, (3) the quark mixing parameters, (4) the excited quarks, leptons, gauge bosons and Higgs scalars and (5) the exotic particles, especially the 'color ball'. Various topics including (1) supersymmetry, (2) superstring phenomenology, (3) technicolor, (4) composite model, (5) new gauge interaction (5)-th force, horizontal gauge model, etc., (6) flavor mixing and symmetry violation (B^0-B-bar^0 mixing, lepton mixing, CP violation search, etc.), (8) under ground experiments and ν physics (solar ν problem, ν from supernova, etc.) and (7) physics perspectives in TRISTAN/SLC/LEP/HERA/TEVATRON/SCC experiments are also discussed. (author).

46464 (KEK–88-10, pp. 191-196) **Rare processes and B physics.** Lim, Chong-Sa (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

It is pointed out that in rare b-decay processes new features, which are not shared by rare decays in K meson system, emerge and are important in the evaluation of the decay rates. Namely, long-distance contribution due to charmed hadrons together with the effect of rather large external quark (b) mass are shown to be even dominant in some decay processes, for the allowed range of t-quark mass. (author).

46465 (KEK–88-10, pp. 197-206) **CP violations in the Neutral B meson system and the four-generation model.** Tanimoto, Morimitsu (Ehime Univ., Matsuyama (Japan). Science Education Lab.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The B_d^0-B-bar$_d^0$ mixing observed by ARGUS Collaboration suggests that the non-lepton asymmetry in the B_d^0-B-bar$_d^0$ system (A_d)

is very large even in the three-generation model, while the non-lepton asymmetry in the B_s^0-B-bar$_s^0$ system(A_s) is suppressed and the lepton asymmetries (a_d, a_s) are very small. However, the asymmetries A_s, a_d and a_s could be also large in the four-generation model. We investigate the relation among A_d, A_s, a_d, a_s and the value of the B_s^0-B-bar$_s^0$ mixing systematically, assuming the relevant hierarchy of the fourth column in the 4 x 4 KM matrix such as (λ^3, λ^2, λ, 1) and (λ^3, λ^3, λ, 1) with the Wolfenstein parameter λ = 0.22. We have found that the predicted values of A_d, A_s, a_d and a_s are strongly restricted by the experimental value of ϵ_K in the neutral K meson system, and have obtained some interesting results which are contrasted to those of the three-generation model. (author).

46466 (KEK–88-10, pp. 210-217) **Extra charged Higgs contributions to flavor changing processes.** Kurimoto, Takeshi (Osaka Univ., Toyonaka (Japan). Coll. of General Education). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

General form of quark-charged Higgs interaction Lagrangian is derived, where neutral flavor conservation is taken into account. Contributions to $\Delta S(\Delta B) = 2$ effective Hamiltonian are estimated by using the obtained Lagrangian. We also show concrete examples of that interaction in some models. (author).

46467 (KEK–88-10, pp. 229-234) **K_L^0 -> μe experiments exploring 100 TeV mass scale.** Shinkawa, Takao (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

Three groups are searching for the K_L^0 -> μe decay, which is a lepton number violating process, with branching ratio sensitivities of $10^{-10} \sim 10^{-12}$ at BNL and KEK. They have preliminary results of 1987 and 1988 data and two experiments will continue data taking until 1989 summer. (author).

46468 (KEK–88-10, pp. 218-228) **Phenomenology of spontaneous CP violation model with neutral flavor conservation.** Kurimoto, T. (Osaka Univ., Toyonaka (Japan). Coll. of General Education); Tanaka, M.; Takasugi, E. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The report addresses an analysis of a spontaneous CP violation model proposed by Ecker, Grimus and Neufield which satisfies neutral flavor conservation in the Higgs sector. Their model has a very interesting Kobayashi-Maskawa matrix which leads to phenomenological results different from standard model. A detailed analysis is made of the phenomenological consequense of this KM matrix, which is explicitly expressed here in a 4 x 4 orthogonal form in the expansion of λ (Cabibbo angle). Wolfenstein type parametrization is derived, and used to analyze ϵ, ϵ'/ϵ parameters in the K system, B deg - B-bar deg oscillation. Then the CP violation asymmetry in Bdeg meson system is examined. The effects of charged Higgs bosons are neglected in the analysis. However, the calculations would be valid for heavy charged Higgs bosons, and light charged Higgs bosons are excluded by electric dipole moment of neutron to which charged Higgs bosons contribute in the one loop level. It is emphasized that nonleptonic decay CP asymmetry in the tree approximation is independent of decay modes in this model, and this is the feature quite different from standard model. (Nogami, K.).

46469 (KEK–88-10, pp. 247-260) **Neutrino oscillations as a possible solution to the anomalous atmospheric neutrino flux.** Hidaka, K. (Tokyo Gakugei Univ., Koganei (Japan)); Honda, M.; Midorikawa, S. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

The masses and mixing pattern of neutrinos are long-standing problems in particle physics. The deficit of neutrino induced muon events recently observed at Kamiokande is very interesting, but the analyses made so far have been based on neutrino flux calculations that neglect the muon polarization effect. Muons produced in pion decay are completely polarized. The electron-type and muon-type neutrios in the muon decay tend to be emitted in the forward and backward directions with respect to the muon momentum, respectively. This effect makes the energy spectrum of the ν_μ flux soft and that of the ν_e hard. It is shown here that this effect is not large enough to explain the deficit. Investigation of the atmospheric the ν_μ and ν_e fluxes indicates that they deviate significantly from the expected values even if the investigation takes into account the effect of the polarization of the muons which are produced mainly by π -> $\mu\nu$ decay. It is found possible to explain the data by three-neutrino oscillations. The two neutrino oscillations ν_e reversible ν_μ are not favored. Models of three neutrino flavors with neutrino mass squared differences of order $10^{-2}eV^2$ can solve both the solar and the atmospheric neutrino problems simultaneously. (N.K.).

46470 (KEK–88-10, pp. 281-289) **Possible test of asymptotic behaviours from sum rules.** Igi, Keiji (Tokyo Univ. (Japan). Dept. of Physics); Kroll, P. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

In 1987, the UA4 collaboration measured the ratio rho(p p-bar) of real to imaginary part of the (pp) forward scattering amplitude at 546GeV centre-of-mass energy. Their result rho(p p-bar) = 0.24+-0.04 is surprisingly large. Normally one would expect rho(p p-bar) to lie between 0.11 and 0.15 from the dispersion approach. The present report describes how to test the crossing-odd part of high energy total cross sections of several models (including the odderon) using sum rules from a new stand point. The P' sum rule was proposed to test the J-plane singularities with vacuum quantum number, and P'(f) Regge trajectory was discovered a long time ago. Here, this idea is followed to the crossing-odd amplitude but in a somewhat modern way. The crossing-odd (spin averaged) forward amplitude for pp and (p p-bar) scattering is defined and an unsubtracted dispersion relation of a form suitable for numerical calculation is derived. Theoretical calculations of $ReF^{(-)}(\omega)$ at high energies are compared with experimental values. A study is made to check the validity of the unsubtracted dispersion relation which indeed is closely consistent with Regge asymptotics. This does not give such a large value for rho(p p-bar) = 0.24+-0.04 as measured by UA4 at 540GeV. Other asymptotic behaviours such as the odderon or a real constant or combinations are not ruled out completely but the strength of these terms has to be small. (Nogami, K.).

46471 (KEK–88-10, pp. 341-349) **Heavy quarks and leptons.** Asano, Yuzo (Tsukuba Univ., Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

Detectability of heavy quarks and leptons in high energy hadron-hadron collision is discussed from an experimental point of view. Some of the problems encountered in the experiment are pointed out, but their solutions are not given yet. (author).

46472 (KFKI–1989-22/A) **Simple expression for the entropy of a fireball from experimental strange particle ratios.** Levai, P.; Lukacs, B.; Zimanyi, J.; Heinz, U. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Apr 1989. 32p. Order Number DE89635938/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

An expression is derived for the specific entropy S/N_B in a non-interacting, non-relativistic Boltzmann gas mixture in terms of strange particle ratios. Then the influences of relativistic and quantum statistical effects and the role of hadronic interactions on

reconstructing the specific entropy from the particle ratios are studied. Since neglect of the relativistic effects causes the largest correction, they are included in an improved expression. The resulting formula gives the specific entropy from the observed particle ratios with less than 20% error. (author) 24 refs.; 3 figs.

46473 (NBI-HE–89-26) **A condensate solution of the electroweak theory which interpolates between the broken and the symmetric phase.** Ambjoern, J.; Olesen, P. Niels Bohr Inst., Copenhagen (Denmark). May 1989. 12p. Order Number DE89915284/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

We discuss a magnetic type solution of the classical electroweak equations with the property that for fields larger than m_w^2/e a W- and Z-condensate is formed. When the average magnetic field reaches the value $m_w^2/e\ \cos^2\theta$ the SU(2)xU$_Y$(1) symmetry is restored. We compare to the finite temperature case. It is mentioned that large magnetic fields of order m_w^2/e (realized e.g. near the superconducting cosmic string) can actually be achieved in earth-bound laboratories as the field surrounding quarks in e.g. proton-proton collisions with more than 1 TeV energy. However, we do not know if the field lasts long enough to produce a W-Z plasma. (orig.).

46474 (ORNL/TM–11257) **Calculated inclusive neutron production from 400 GeV proton-nucleus collisions.** Alsmiller, R.G. Jr.; Alsmiller, F.S.; Hermann, O.W. Oak Ridge National Lab., TN (USA). Aug 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89016939/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Calculated inclusive neutron production from 400 GeV proton-nucleus collisions is presented and compared with experimental data. Target nuclei H, Be, Cu, and Pb are considered and the comparisons cover the laboratory energy range of 20 to 400 GeV, and angular range 0.7 to 10 mr. Moderately good agreement between the calculated and experimental data is found, but the agreement in the case of Be, Cu and Pb is significantly better than in the case of H. 8 refs., 4 figs.

46475 (RAL–89-021) **E$^+$e$^-$ annihilation at high energies.** Marshall, R. Rutherford Appleton Lab., Chilton (UK). May 1989. vp. Available from British Library, Lending Division, Boston Spa, Wetherby, West Yorks.

The experimental physics programme of PEP and PETRA is presented. The data from 11 independent experiments are collated and compared with theory. The review starts with a brief history of e$^+$e$^-$ interactions and then gives brief technical details of the two accelerators and the 11 experimental detectors. The physics of hadron production is considered and the production yield per event of hadrons detected is given. The confrontation of the measurements of hadron production with quantum chromodynamic (QCD) theory is considered together with the status of the understanding of fragmentation. A chapter is devoted to the electroweak interaction and results are presented from an analysis combining the data from the various experiments on lepton and quark pair production. Some aspects of heavy flavour physics are described using measurements on the decays of tau leptons and the c and b quarks. In the case of the tau the most accurate determination to date of the Fermi constant, derived from tau decay is given, together with the first ever result on the value of g-2 for the tau. The most stringent limits obtained so far are presented on the mass of the tau neutrino, and on the number of neutrino generations, obtained by combining the results from several experiments. A summary of the searches for new particles is given and the review ends with a look at the new e$^+$e$^-$ accelerators now coming into operation and the prospects for continuing developments into the next century. (author).

46476 (RAL–89-038) **Polarised structure functions in the parton model.** Jackson, J.D.; Ross, G.G.; Roberts, R.G. Rutherford Appleton Lab., Chilton (UK). May 1989. 11p. Available from British Library, Lending Division, Boston Spa, Wetherby, West Yorks.

It is shown that a covariant form of the parton model is necessary for consistent predictions of the nucleon spin structure functions. Sum rules relating g_2 to g_1 are derived and the limits of their applicability discussed. The measurement of g_1 is shown to give a direct estimate of the mean k_T as a function of x yielding values consistent with experiment and with an independent estimate we derive from a covariant formulation of the parton model for the unpolarised structure functions. With the assumption of dominance of $k^2 \simeq 0$, it is shown that the polarised and unpolarised covariant parton distributions themselves as functions of pcenter dotk can be extracted from the data, giving a complete specification of the covariant relativistic parton model. (author).

46477 (SLAC-PUB–5018) **Predictions for CP violation.** Gilman, F.J. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8906204–1: International symposium on heavy quark physics, 13-17 Jun 1989). Order Number DE89016691/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Predictions for CP violation in the three-generation Standard Model are reviewed, especially as they pertain to the K and B meson systems. 39 refs., 19 figs.

46478 (SLAC-PUB–5025) **Renormalization schemes: Where do we stand?.** Ward, B.F.L. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515;AS05-76ER03956. (UTHEP–89-0701;CONF-8907136–1: NATO advanced research workshop on radiative corrections: results and perspectives, 9-14 Jul 1989). Order Number DE89015632/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

We consider the status of the current approaches to the application of the renormalization program to the standard $SU_{2L} \times U_1$ theory from the standpoint of the interplay of the scheme chosen for such an application and the attendant high-precision tests of the respective loop effects. We thus review the available schemes and discuss their theoretical relationships. We also show how such schemes stand in numerical relation to one another in the context of high-precision Z^0 physics, as an illustration. 15 refs., 2 figs., 2 tabs.

46479 (SLAC-PUB–5030) **V_{cd} and V_{cs} from current models.** Ward, B.F.L. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515;AS05-76ER03956. (UTHEP–89-0702;CONF-8905144–7: Tau-Charm workshop, 23-27 May 1989). Order Number DE89015634/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

We discuss the theoretical uncertainties attendant to the determination of $|V_{cd}|/|V_{cs}|$ from semileptonic D decay. Four different theoretical approaches are considered. Currently, agreement at the level of a factor of 2 for the various theoretical approaches exists so that, indeed, precise experimental data – such as precise lepton energy spectra and decay width data – would discriminate among the models considered. 8 refs., 1 fig.

46480 (SLAC-PUB–5051) **Phenomenology of the CKM [Cabibbo-Kobayashi-Maskawa] matrix.** Nir, Y. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8906204–2: International symposium on heavy quark physics, 13-17 Jun 1989). Order Number DE89015639/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The way in which an exact determination of the CKM matrix elements tests the Standard Model is demonstrated by a two generation example. The determination of matrix elements from meson semi-leptonic decays is explained, with an emphasis on the respective reliability of quark level and meson level calculations. The assumptions involved in the use of loop processes are described. Finally, the state of the art of our knowledge of the CKM matrix is presented. 19 refs., 2 figs.

46481 (SLAC-PUB–5083) **Unsolved problems in hadronic charm decay.** Browder, T.E. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Aug 1989. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–11: Tau-Charm workshop, 23-27 May 1989). Order Number DE89016951/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper describes several outstanding problems in the study of hadronic decays of charmed mesons where further experimental work and theoretical understanding is needed. Four topics are stressed: double Cabibbo suppressed decays (DCSD) of D^+ mesons, hadronic D_s decays, weak hadronic quasi-two-body decays to pairs of vector mesons, and penguin decays of D mesons. 24 refs., 10 figs., 5 tabs.

46482 Remarks on the mass scales, mixing angles, and signatures of the fourth-generation quarks. Hamzaoui, C. (Department of Physics, Concordia University, Montreal, Quebec, Canada H3G IM8(CA)); Sanda, A. I.; Soni, A. *Physical Review Letters (USA),* 63(2): 128-131 (10 Jul 1989).

Assuming that the fourth family makes an appreciable contribution to B mixing, assuming some mild properties of the (4×4) Cabibbo-Kobayashi-Maskawa matrix, and taking the lattice determination of the pseudoscalar decay constant for B seriously, we arrive at a lower bound on m_t, i.e., $m_{t'} \gtrsim 500$ GeV. If perturbative unitarity is to be preserved, i.e., $m_{t'} \sim 500$ GeV, then our analysis also implies that the top quark is unlikely to be lighter than ≈80 Gev. Experimental consequences for rare B decays, and CP violation in B decays are also discussed.

46483 (BONN-IR–88-41) **Conformal invariance and critical properties of quantum chains with defects.** Schlottmann, M. Bonn Univ. (Germany, F.R.). Physikalisches Inst.; Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet. Jul 1988. 36p. (In German). Order Number DE89915158/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

This thesis is based on the question whether and how the introduction of defects in two-dimensional conformal-invariant systems, especially models the transfer matrix of which is given by one-dimensional Z_n symmetric quantum chains, influences the conformal symmetry. First by duality transformation of general Z_n symmetric quantum chains under exact regardment of boundary conditions the relation of systems with defects to systems which interact with surface fields is exposed. Thereafter it was shown that the conformal symmetry by switching on of defects for certain defect configurations is not completely broken. The question whether these results can be transferred to more general models was studied on the example of the three-state Potts model with a defect by means of numerical methods. A transition scheme for the Virasoro representations in the interpolation between the representations at the known points in the space of the defect parameters could be proposed by which the numerical results are consistent. However it is to be stated that the numerical results give in no way a proof for the partial conservation of conformal invariance; an analytical construction of the Virasoro generators analoguously to the Ising model has not succeeded. Also it was stated that no additional structure in form of Kac-Moody algebras is present. (orig./HSI).

46484 (IC–89/68) **Construction of two dimensional super potentials for classical super systems.** Mishra, S.C. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 6p. Order Number DE89635733/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Construction of super potentials for two dimensional classical super systems (for $N \geq 2$) is carried out. Some interesting potentials have been studied in their super form. (author). 3 refs.

46485 (KEK–88-10, pp. 173-190) **Scale-invariant technicolor and a technidilaton.** Yamawaki, Koichi (Nagoya Univ. (Japan). Dept. of Physics). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

As to the mass of quarks and leptons, the problem of excessive flavor-changing neutral currents (FCNC's), roughly 10^3 times the experimental limit, has long been a fatal disease to the technicolor (TC) theories. Also, most TC models predict light pseudo Nambu-Goldstone bosons (PNGB's) with $J^{PC} = 0^{-+}$ in the reion <10 GeV, which are already excluded by the experiment. Because of these, these has been a widely spreading folklore that TC is dead. It is argued here, however, this is no longer true in the modern version of TC, which, in contrast to the classical one, is not a naive scale-up of QCD. The report describes the scale-invariant technicolor model characterized by the ladder Schwinger-Dyson equation. It is found that the theory has a non-trivial ultraviolet fixed point with large anomalous dimension, which naturally supresses the flavor-changing neutral currents (FCNC's) and at the same time raises the mass of the problematic light technipions. The model is expected to predict a dilaton (technidilaton), a light $J^{PC}=O^{++}$ pseudo Nambu-Goldstone bosons associated with the spontaneous breakdown of the scale invariance, whose dynamical issues are argued in detail. The model is compared with the running coupling constant varied slowly in the ladder-like Schwinger-Dyson equation; it is found that enough suppression of FCN's is only possible in the scale-invariant model. (N.K.).

We discuss advantages and disadvantages of three equivalent lattice actions proposed before for anomalous chiral gauge theories. Applications to the chiral Scwinger model and the four dimensional chiral QED are presented. 12 refs.

46487 (BNL–42855) **The standard model and beyond.** Marciano, W.J. Brookhaven National Lab., Upton, NY (USA). May 1989. 31p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8810409–1: 10. Autumn School on physics beyond the standard model, 10-14 Oct 1988). Order Number DE89015112/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In these lectures, my aim is to present a status report on the standard model and some key tests of electroweak unification. Within that context, I also discuss how and where hints of new physics may emerge. To accomplish those goals, I have organized my presentation as follows. I survey the standard model parameters with particular emphasis on the gauge coupling constants and vector boson masses. Examples of new physics appendages are also commented on. In addition, I have included an appendix on dimensional regularization and a simple example which employs that technique. I focus on weak charged current phenomenology. Precision tests of the standard model are described and up-to-date values for the Cabibbo-Kobayashi-Maskawa (CKM) mixing matrix parameters are presented. Constraints implied by those tests for a 4th generation, extra Z' bosons, and compositeness are discussed. An overview of the physics of tau decays is also included. I discuss weak neutral current phenomenology and the extraction of $\sin^2\theta W$ from experiment. The results presented there are based on a global analysis of all existing data. I have chosen to concentrate that discussion on radiative corrections, the effect of a heavy top quark mass, implications for grand unified theories (GUTS), extra Z' gauge bosons, and atomic parity violation. The potential for further experimental progress is also commented on. Finally, I depart from the narrowest version of the standard model and discuss effects of neutrino masses, mixings, and electromagnetic moments. 32 refs., 3 figs., 5 tabs

46488 (BNL–42968) **Lattice fields and strong interactions.** Creutz, M. Brookhaven National Lab., Upton, NY (USA). Jun 1989. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8905143–3: NATO international advanced course on the nuclear equation of state, 12 May - 3 jun 1989). Order Number DE89015099/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

I review the lattice formulation of gauge theories and the use of numerical methods to investigate nonperturbative phenomena. These methods are directly applicable to studying hadronic matter at high temperatures. Considerable recent progress has been made in numerical algorithms for including dynamical fermions in such calculations. Dealing with a nonvanishing baryon density adds new unsolved challenges. 33 refs.

46489 (CONF-8903130–2) **Singularity theory and N = 2 superconformal field theories.** Warner, N.P. Massachusetts Inst. of Tech., Cambridge, MA (USA). Center for Theoretical Physics. 1989. 7p. Sponsored by DOE/ER;NSF. DOE Contract AC02-76ER03069. (CTP–1745). From Strings '89 conference; 13-18 Mar 1989. Order Number DE89016582/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The N = 2 superconformal field theories that appear at the fixed points of the renormalization group flows of Landau-Ginsburg models are discussed. Some of the techniques of singularity theory are employed to deduce properties of these superconformal theories. These ideas are then used to deduce the relationship between Calabi-Yau compactifications and tensored discrete series models. The chiral rings of general N = 2 superconformal theories are also described. 14 refs.

46490 (DOE/ER/40423–03-P9) **Analytic strong-coupling expansion in 1/e for the electron propagator without fermion loops in quantum electrodynamics.** Carrier, D. Washington Univ., Seattle, WA (USA). Dept. of Physics. 1989. 33p. Sponsored by U.S. DOE Energy Research. DOE Contract AS06-88ER40423. Order Number DE89017322/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Starting from the path-integral representation for the electron propagator without fermion loops in QED, we analytically investigate the strong-coupling behavior in an arbitrary background electromagnetic field through a series expansion in powers of 1/e. Contrary to the perturbation theory expansion in e the new series only contains positive powers of the derivative operator p. Due to infrared singularities in the path integral the series does not exist beyond the lowest orders, although one can build a systematic expansion in powers of p (not 1/e) which can be calculated up to any order. To handle infinities we regularize using a Pauli-Villars approach. The introduction of fermion loops would not correspond to higher orders in 1/e, so a priori our results are only pertinent to the sector of QED we have chosen. 17 refs., 1 fig.

46491 (FNAL/C–89/164-T) **Spontaneous symmetry breaking in 4-dimensional heterotic string.** Maharana, J. Fermi National Accelerator Lab., Batavia, IL (USA). Jul 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-8907129–1: NATO advanced research workshop on physics and geometry, 2-8 Jul 1989). Order Number DE89016284/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The evolution of a 4-dimensional heterotic string is considered in the background of its massless excitations such as graviton, antisymmetric tensor, gauge fields and scalar bosons. The compactified bosonic coordinates are fermionized. The world-sheet supersymmetry requirement enforces Thirring-like four fermion coupling to the background scalar fields. The non-abelian gauge symmetry is exhibited through the Ward identities of the S-matrix elements. The spontaneous symmetry breaking mechanism is exhibited through the broken Ward identities. An effective 4-dimensional action is constructed and the consequence of spontaneous symmetry breaking is envisaged for the effective action. 19 refs.

46492 (IC–89/52) **Renormalization group flows in N=2 superconformal models.** Kei Ito. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 8p. Order Number DE89635720/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

We derive the renormalization group flow patterns in the A-D-E classification of N=2 superconformal discrete series, induced by relevant operators (tachyon fields). The flow pattern is consistent with Zamolodchikov's c-theorem. (author). 7 refs.

46493 (IC–89/65) **Off-shell closed strings as the topological open membranes. Dynamical transmutation of world sheet dimension.** Kogan, Y.I. International Centre for Theoretical Physics, Trieste (Italy). May 1989. 9p. Order Number DE89635721/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Using the connection between (2+1) Chern-Simons gauge theory and 2d Conformal Field Theory the on-shell string condition is obtained as a condition of full independence of interior of (2+1) world. The new method for off-shell continuation is considered based on the introduction of the Maxwell term in (2+1) theory. This leads to dynamical transmutation of world-sheet dimensions - the off-shell string becomes topological membrane (topological means that (2+1) theory has topological mass term). The dependence of parameters of (2+1) theory under the external fields is discussed. (author). 17 refs.

46494 (IC–89/71) **Stable supermembrane vacuum with a discrete spectrum.** Duff, M.J.; Pope, C.N.; Sezgin, E. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 9p. (CTP-TAMU–1/89). Order Number DE89635722/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

We examine the massless spectrum of the supermembrane in the background of four-dimensional anti-de Sitter space times a compact internal space, by considering quantisation about a collapsed membrane configuration. We also observe that the vacuum is stable and that the spectrum of massive states is necessarily discrete. In this respect, the supermembrane favours anti-de Sitter over Minkowski space, where the spectrum seems likely to be continuous. (author). 19 refs.

46495 (IC–89/106) **Modular transformations of conformal blocks in WZW models on Riemann surfaces of higher genus.** Miao Li; Ming Yu. International Centre for Theoretical Physics, Trieste (Italy). May 1989. 23p. Order Number DE89635718/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

We derive the modular transformations for conformal blocks in Wess-Zumino-Witten models on Riemann surfaces of higher genus. The basic ingredient consists of using the Chern-Simons theory developed by Witten. We find that the modular transformations generated by Dehn twists are linear combinations of Wilson line operators, which can be expressed in terms of braiding matrices. It can also be shown that modular transformation matrices for $g > 0$ Riemann surfaces depend only on those for $g \leq 3$. (author). 13 refs, 15 figs.

46496 (IC–89/108) **Gauge theories of infinite dimensional Hamiltonian superalgebras.** Sezgin, E. International Centre for Theoretical Physics, Trieste (Italy). May 1989. 12p. Order Number DE89635719/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Symplectic diffeomorphisms of a class of supermanifolds and the associated infinite dimensional Hamiltonian superalgebras, H(2M,N) are discussed. Applications to strings, membranes and higher spin field theories are considered: The embedding of the Ramond superconformal algebra in H(2,1) is obtained. The Chern-Simons gauge theory of symplectic super-diffeomorphisms is constructed. (author). 29 refs.

46497 (IN2-P3–89-01, pp. 93-212) **Compactification and phenomenology.** Binetruy, P. (Grenoble-1 Univ., 74 - Annecy (FR). Lab. de Physique des Particules). Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France). 1989. (CONF-8709294–: 19. Available from NTIS (US Sales Only), PC A13/MF A01.

The compactification process and the effective field theory that emerges at the outcome of compactification are introduced, using compactification of the Calabi-Yau manifolds. Mcomp, the scale typical of compactification (typically by dimensional analysis, the inverse radius of the compact manifold) is introduced. The effective theory is taken from Mcomp down to energies accessible to experiment. In the process, supersymmetry and part of the gauge symmetry are broken, and particles acquire a mass (fields which acquired a mass at the string compactification level are superheavy

and have decoupled). The state of experimentation is summarized, and the prospect of finding new particles is assessed. The connection between string models and particle physics is stressed.

46498 (IN2-P3–89-01, pp. 59-92) **Construction of strings and superstrings in arbitrary space-time dimensions.** Kounnas, C. (Ecole Normale Superieure, 75 - Paris (FR). Lab. de Physique Theorique). Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France). 1989. (CONF-8709294–: 19. Ecole de Physique des Particules (Gif-sur-Yvette summer school of Particle Physics), 7-11 Sep 1987). In *Strings and superstrings. Electron linear colliders.* Order Number DE89903207/JAW. Available from NTIS (US Sales Only), PC A13/MF A01.

String models with space-time chiral fermions and physically relevant interactions may easily be constructed in space-time dimensions lower than ten by using different versions of the underlying two-dimensional superconformal theory. The fundamental string constraints and their general solutions are presented for the case of closed strings in which all the string internal quantum numbers are carried by free periodic and antiperiodic world sheet fermions. We also present a symmetry breaking mechanism, for gauge symmetry and supersymmetry, which operates on the string level. This mechanism defines new string solutions which are characterized by a mass spectrum depending upon several breaking parameters, therefore introducing new arbitrary continuous parameters on strings.

46499 (IN2-P3–89-01, pp. 3-34) **Introduction to string theory.** Alessandrini, V. (Paris-11 Univ., 91 - Orsay (FR). Lab. de Physique Nucleaire et Hautes Energies). Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France). 1989. (In French). (CONF-8709294–: 19. Available from NTIS (US Sales Only), PC A13/MF A01.

Open and closed boson theories are discussed in a classical framework, highlighting the physical interpretation of conformal symmetry and the Virasoro (1970) algebra. The quantification of bosonic strings is done within the old covariant operational formalism. This method is much less elegant and powerful than the BRST quantification, but it quickly reveals the physical content of quantum theory. Generalization to theories with fermionic degrees of freedom is introduced: the Neveu-Schartz (1971) and Ramond (1971) models, their reduced supersymmetry (two dimensions) and the Gliozzi, Scherk and Olive (1977) projection which leads to a supersymmetry theory in the usual meaning of the term.

46500 (IN2-P3–89-01, pp. 35-57) **Strings in interaction.** Schwimmer, A. (Weizmann Inst. of Science Rehovoth (IL). Dept. of Physics). Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France). 1989. (CONF-8709294–: 19. Ecole de Physique des Particules (Gif-sur-Yvette summer school of Particle Physics), 7-11 Sep 1987). In *Strings and superstrings. Electron linear colliders.* Order Number DE89903207/JAW. Available from NTIS (US Sales Only), PC A13/MF A01.

Field theory in the first quantized formalism is introduced. The construction of vertex operators is explained. Interactions of the closed bosonic string are presented.

46501 (INIS-BR–1564) **Model of confinement for quantum chromodynamics in 2+1 dimensions.** Silva Filho, A.C. da. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1986. 106p. (In Portuguese). Order Number DE89635723/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

A dielectric mechanism of QCD in 2 + 1 dimensions is studied. This model yields confinement of two opposite color charges which are infinitely massive, via a linear potential. A functional expression for the dielectric parameter ϵ and studied analitical and numerical the resulting constitutive equations is obtained. A perturbative approach of these yields the non-leading contributions to the asymptotic potential as well for the boundary of the confinement domain. The results obtained for the transversal width of the confinement domain, considering large separations R of color charges, indicate that increases like $R^2$3/, behavior which differs from the one suggested by the string models. (author).

Kratkie Soobshcheniya po Fizike.; no. 11.

In frames of gauge-invariant formulation of stochastically quantized nonabelian theory calculations of one-loop corrections to two-point distribution functions in $A_5=a\partial_\mu A_\mu$ gauges for arbitrary $a>0$ are carried out. Dependence of one-loop counterterms on gauge parameters, in the given approximation providing for finiteness of all Green functions in nonequilibrium phase is obtained. 5 refs.; 3 figs.

46503 (KEK–88-10, pp. 152-172) **Strong coupling phase in QED.** Aoki, Ken-ichi (Kyoto Univ. (Japan). Research Inst. for Fundamental Physics). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8805324–: 2. meeting on physics at TeV energy scale, 23-25 May 1988). In *Proceedings of the second meeting on physics at TeV energy scale.* Order Number DE89906400/JAW. Available from NTIS (US Sales Only), PC A16/MF A01.

Existence of a strong coupling phase in QED has been suggested in solutions of the Schwinger-Dyson equation and in Monte Carlo simulation of lattice QED. In this article we recapitulate the previous arguments, and formulate the problem in the modern framework of the renormalization theory, Wilsonian renormalization. This scheme of renormalization gives the best understanding of the basic structure of a field theory especially when it has a multi-phase structure. We resolve some misleading arguments in the previous literature. Then we set up a strategy to attack the strong phase, if any. We describe a trial; a coupled Schwinger-Dyson equation. Possible picture of the strong coupling phase QED is presented. (author).

46504 (NBI-HE–89-24) **A random walk representation of the Dirac propagator.** Ambjoern, J.; Durhuus, B.; Jonsson, T. Niels Bohr Inst., Copenhagen (Denmark). May 1989. 14p. Order Number DE89915283/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

We define a discrete random walk with a matrix valued transition function and show that the scaling limit of the two point function of the walk is given by the Dirac propagator. We study the scaling limit of similar walks with curvature dependent transition functions, which are analogous to the Ornstein-Uhlenbeck process, and show that the Dirac propagator can be recovered by a limiting procedure. (orig.).

46505 (SLAC-PUB–5022) **Three level constraints on conformal field theories and string models.** Lewellen, D.C. Stanford Linear Accelerator Center, Menlo Park, CA (USA). May 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8903130–3: Strings '89 conference, 13-18 Mar 1989). Order Number DE89016942/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Simple tree level constraints for conformal field theories which follow from the requirement of crossing symmetry of four-point amplitudes are presented, and their utility for probing general properties of string models is briefly illustrated and discussed. 9 refs.

46506 (UCRL–101586) **General covariance and strings.** Klinkhamer, F.R. Lawrence Livermore National Lab., CA (USA). Jul 1989. 5p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8907129–2: NATO advanced research workshop on physics and geometry, 2-8 Jul 1989). Order Number DE89016505/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

It may be that (super)strings are part of the elusive quantum theory of gravity. If so, one obvious question is whether or not string field theory is generally covariant. Recall that string field theory (for a review see Ref.1) involves the string creation/annihilation operator $\Phi[X]$, where, for brevity, we omit the ghost coordinates. The action of the free open string is $\int DX\ \Phi[X]\ Q\ \Phi[X]$, where $Q = Q(X, \delta/\delta X)$ is the so called BRST operator and $\int DX$ integrates over the space of all strings, i.e., "loop space." Since both DX and Q involve the Minkowski metric $\eta_{\mu\nu}$ the action is clearly not generally covariant.

Actually, we are interested in covariance not only over the finite dimensional "target space" but over the infinite dimensional "loop space." The most straight forward thing to do is to introduce a background loop space metric and to follow, as closely as possible, the steps of standard general relativity. Here I will list the basic results only. 3 refs.

46507 Zamolodchikov metric and effective Lagrangians in string theory. Cveti@/rc@ (Department of Physics, University of Pennsylvania, Philadelphia, Pennsylvania 19104-6396(US)); w, M.; Ovrut, B. A.; Louis, J. *Physical Review [Section] D: Particles and Fields (USA)*, 40(2): 684-687 (15 Jul 1989). DOE Contract AC02-76ER03071;AC03-76SF00515.

Using the (1,0) superspace formalism, we calculate the Zamolodchikov metrics for moduli and 27,27¯ matter scalars in the untwisted sector of (2,2)-symmetric Z_N orbifolds. These metrics are found to be the same as the metrics in the effective Lagrangians of untwisted moduli and matter scalars obtained previously by different methods. This result is strong evidence that the Zamolodchikov metric and the metric on the manifold of scalars in the effective Lagrangian are identical for all string theories.

46508 Possible high T_c superconductivity in the Ba-La-Cu-O system. Bednorz, J.G. (IBM Zuerich Research Lab., Rueschlikon (Switzerland)); Mueller, K.A. pp. 1197 of Physics of particle accelerators. Volume 2. Month, M.; Dienes, M. (eds.) American Institute of Physics, New York, NY (1989). (CONF-8808234–Vol.2-Exc.: U.S. Particle Accelerator School: physics of particle accelerators; U.S. Particle Accelerator School, 20 Jul - 14 aug 1987; aug 1988).

The author covers the technology of the new oxide superconductors and how they might relate to the existing superconductors. Replacement of metallic helium-temperature superconductors such as Nb-Ti or Nb_3Sn by high temperature superconductors does not look at all feasible at present. The low transport J_c granular behavior is widely recognized. Disconnected behavior continues to preclude even demonstration magnets. 10 figures, 1 table.

46509 (GSI–89-15) **1.4 decades of 1.4 MeV/u heavy ion beams.** Mokler, P.H. (ed.). Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.). May 1989. 255p. Order Number DE89915167/JAW. Available from NTIS (US Sales Only), PC A12/MF A01.

This report is a collection of the annual reports from 1976 to 1978 and scientific reports from 1979 to 1988 together with a list of publications and university degrees of the GSI Darmstadt. The work concerns heavy ion reactions, atomic collisions, studies of radiation effects in solids and biology, and detector development. (HSI).

46510 (IAEA-TECDOC–491, pp. 69-72) **Measured dependence of effective cross-sections on thermal neutron temperature.** Okazaki, A. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Jones, R.T. International Atomic Energy Agency, Vienna (Austria). Jan 1989. (CONF-8712144–: Advisory group on nuclear data for the calculation of thermal reactor reactivity coefficients, 7-10 Dec 1987). In *Nuclear data for the calculation of thermal reactor reactivity coefficients. Proceedings of an advisory group meeting held in Vienna, 7-10 December 1987.* Order Number DE89635489/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The variation of effective cross sections with temperature of Maxwellian neutron distributions has been measured for fission in U233, U235 and Pu239, and for capture in U238, Th232, Cu63, In115, Lu176 and Au197. Foil activation methods were used. Mn55, which has a 1/v dependence, was used as the reference. The results agree within the estimated uncertainties with the ENDF/B-V data except for Lu176 and Au197. (author). 7 refs, 8 figs.

46511 (IPEN-PUB–249) **Photofission cross sections of U-233 and Pu-239 near threshold induced by gamma-rays from thermal neutron capture.** Moraes, M.A.P.V. de; Cesar, M.T.F. Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). Feb 1989. 23p. Order Number DE89635987/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The photofission cross sections of U-233 and PU-239 have been studied using monochromatic photons produced by thermal neutron capture in several materials placed in a radial beam hole of the IEA-R1, 2 MW pool type research reactor, in the energy interval from 5.43 MeV to 9.72 MeV. The gamma flux incident on the samples were measured using a (3X3) inch. NaI(Tl) crystal. The photofission fragments were detected in MAKROFOL-KG (solid state nuclear track detector) etched 30 min. in a KOH (35%wt) solution at 60^0C. The efficiency of the detector was obtained using a Californium-252 calibrated source and its value was (0.4323 +- 3%). The tracks were counted by means of an automatic spark counting. Analyzing the photofission data we have observed similarities between the cross sections obtained for the two samples in comparison with other authors. A structure was also observed in the U-233 cross section near the energy of 7.23 MeW. Acoording to the liquid drop model the height of the simple fission barrier were determined: (5.6 +- 0.2) MeV and (5.7 +- 0.2) MeV for U-233 and Pu-239 respectively. The relative fissionability of the samples to U-238 were also determined in each excitation energy and showed to be energy independent: (2.12 +-0.25) for U-233, and (3.32+-0.41) for Pu-239. (author).

46512 (ORNL/FTR–2911) **[Medium-energy heavy-ion excitation and photon decay of giant resonances]: Foreign trip report, June 3, 1988–June 12, 1988.** Bertrand, F.E. Oak Ridge National Lab., TN (USA). 20 Jun 1988. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017277/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler presented an invited talk, entitled "Medium-Energy Heavy-Ion Excitation and Photon Decay of Giant Resonances," at the Third International Conference on Nucleus Nucleus Collisions held in Saint-Malo, France, June 6–11, 1988. This excellent conference was attended by over 400 nuclear physicists and provided a varied program in heavy-ion research.

46513 (ORNL/FTR–3191) **[Lifetime of unresolved states]: Foreign trip report, March 6, 1989–March 10, 1989.** Lee, I-Yang. Oak Ridge National Lab., TN (USA). 14 Mar 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017353/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler gave a talk, "Lifetimes of Unresolved States," at the Workshop on Nuclear Structure at High Spins, at Bad Honnef, West Germany. The presentations and discussions at the meeting were on recent results on high-spin nuclear spectroscopy. The European plan for the next generation gamma-ray detector array, Euroball, was also discussed.

46514 (BONN-IR–88-11) **Development of a vector and tensor polarized deuteron target and measurement of the target asymmetry in the photon-deuteron fission at 450 MeV and 650 MeV photon energy.** Schilling, E.P. Bonn Univ. (Germany, F.R.). Physikalisches Inst.; Bonn Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet. Mar 1988. 107p. (In German). Order Number DE89915163/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

High vector- and tensor polarization was achieved with the newly-developed target material deuterated ammonia (ND_3). For the dynamic nuclear polarization (DNP) the material was prepared by irradiation under liquid argon at 90 K with electrons of the Bonn 20

MeV injection Linac. At a magnetic field of 2.5 T and a temperature of 0.2 K we yielded a vector polarization of 0.44. The highest value 0.49 was obtained at 3.5 T after further 'in situ' irradiation during the measurement of spin observables of the deuteron. The corresponding values for the tensor polarization are 0.15 and 0.19. In addition, a method to enhance tensor polarization is introduced. This method bases on the saturation of RF-transitions in the deuteron spin system. The applicance to distinct deuteron spin-flip transitions in a single crystal is very effective. This has been demonstrated with promising results. At the Bonn 2.5 GeV Electron Synchrotron we have measured two angular distributions of the target asymmetry of the reaction $\gamma + d_{\uparrow} \rightarrow p + n$ at photon energies of 450 MeV and 650 MeV and at proton-cm-angles between 25^0 and 155^0. For one kinematical setting also the tensor asymmetry was measured. Proton and neutron were detected in coincidence. Our results are compared with recent analyses. (orig.).

46515 (CONF-8907127–1) **High energy deutron photodisintegration.** Napolitano, J. SLAC NE8 Collaboration. Virginia Univ., Charlottesville, VA (USA). 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER40390. From 12. few body conference; 2-8 Jul 1989. Order Number DE89016391/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Results are presented for two-body deuteron photodisintegration, i.e., $d(\gamma,p)n$, at $\theta_{CM} = 90°$ and for photon energies up to 1.6 GeV. These results are discussed in the light of several theoretical models. The data suggest that, at the highest energies, the energy dependence of the cross section is that given by simple constituent counting. We also discuss the need for additional work, both experimental and theoretical, to help resolve conflicting points of view. 4 refs., 4 figs.

Kratkie soobshcheniya po fizike.; no. 10.

Differential cross-sections of $^{12}C(\gamma, \pi^+)^{12}B$(0.95 MeV) reactor reaction for 45 and 82 deg angles of pion escape in 70-160 MeV pion energy range were measured. Correlation os experimental data with calculations, conducted in impulse approximation with distorted waves is presented. 14 refs.; 2 figs.

46517 (KFK–4564) **Elastic break-up of 156 MeV ^{6}Li projectiles with large asymptotic relative momenta of the fragments.** Heide, N.; Rebel, H.; Gils, H.J.; Jelitto, H.; Kiener, J.; Wentz, J.; Zagromski, S.; Corcalciuc, V.; Srivastava, D.K. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik. May 1989. 31p. Order Number DE89915143/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The triple differential cross sections for elastic break-up of 156 MeV ^{6}Li projectiles by the reactions ^{208}Pb (^{6}Li, ad) $^{208}Pb_{g.s.}$, and ^{12}C (^{6}Li, ad) $^{12}C_{g.s.}$ have been measured with large asymptotic relative momenta of the outgoing fragments. The data exhibit rather unfamiliar shapes of the energy spectra, often replacing the usual bell-shape distributions by double-peaked structures and varying rapidly with the relative emission angles. The origin of these features has been explored and the cross sections have been analysed on the basis of a diffractive disintegration approach. (orig.).

46518 (KFK–4584) **Nuclear structure effects in elastic ^{12}C + ^{12}C scattering.** Galachmatova, S.; Romanovsky, E.; Shirokova, A.; Shitikova, K.V.; Gils, H.J.; Rebel, H. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik. May 1989. 12p. Order Number DE89915144/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Elastic ^{12}C + ^{12}C scattering cross sections measured at incident energies of 13.8 MeV/amu and of 9.8 MeV/amu are analysed within the semimicroscopic approach of the standard double-folding model. The influence of different forms of the ^{12}C-nucleon density distribution is studied. It turns out that the experimental cross sections give some preference for a density distribution resulting from an α-cluster model description of ^{12}C. (orig.).

46519 (LA–11656-MS) **Differential neutron production cross sections and neutron yields from stopping-length targets for 256-MeV protons.** Meier, M.M.; Amian, W.B.; Goulding, C.A.; Morgan, G.L.; Moss, C.E. Los Alamos National Lab., NM (USA). Aug 1989. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE89015976/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have measured differential (p,xn) cross sections, $d^2\sigma/d\Omega dE_n$, from thin targets and absolute neutron yields from stopping-length targets at angles of 7.5°, 30°, 60°, and 150° for the 256-MeV proton bombardment of elemental beryllium, carbon, aluminum, and iron. Additional cross-section measurements are reported for oxygen, lead, and ^{238}U. We used time-of-flight techniques to identify and discriminate against backgrounds and to determine the neutron energy spectrum. Comparison of the experimental data with intranuclear-cascade evaporation-model calculations using the code HETC showed discrepancies in the differential cross sections by as much as a factor of 7, notably at 7.5° and 150°, and much better agreement for the stopping-length targets where transport presumably dominates production effects in the calculations. 15 refs., 16 figs., 4 tabs.

46520 (CRN-PN–88-32) **Beta decay of ^{30}Na: experiment and theory.** Baumann, P.; Dessagne, P.; Huck, A.; Klotz, A.; Knipper, A.; Miehe, C.; Ramdane, M.; Walter, G.; Marguier, G.; Gabelmann, H. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1988. 30p. Order Number DE89908091/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The ^{30}Na β decay was studied on-line by means of mass-separation techniques. Gamma-ray, gamma-gamma, neutron-gamma spectra, neutron time-of-flight singles and γ-coincidence measurements, were registered. High-energy neutron branches (E_n >2 MeV) were found complementing previouly reported data. A ^{30}Na β-decay scheme to ^{30}Mg bound and unbound states is established. The distribution of the transition strength as a function of the excitation energy for particle-unbound levels in ^{30}Mg is compared to shell-model calculations performed in the 0-12 MeV excitation energy range. An overall renormalization yields a B(GT) quenching factor of 0.28 substantially lower than generally observed in this mass region. Three levels in ^{29}Mg which are strongly populated via the 1n-channel are related to negative parity intruder states.

46521 (INIS-BR–1569) **Studies of elastic scattering and cross sections of the ^{12}C + ^{28}Si system.** Oliveira Junior, J.M. de. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1988. 110p. (In Portuguese). Order Number DE89635990/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

Angular distributions of the elastic scattering of the system $^{12}C+^{28}Si$ were measured at the energies E_{CM} = 14.70; 16.08; 18.90; 20,97; 21.87 MeV, in the angular range $15^0 \leq \theta_{CM} \leq 170^0$, with angular steps of 1^0. Other seven angular distributions measured by Villari, Ost and Cheng at energies E_{CM} = 17.50; 19.60; 20.30; 22.40; 23.80; 24.50 and 25.20 MeV, have also been used in our analysis. The angular distributions have been reproduced by optical model calculations and new optical potentials for the system $^{12}C+^{28}Si$ were obtained. Calculations of the total reaction cross section from the elastic scattering data using a model independent method were done. The results were compared with fusion cross section data and with total reaction cross sections obtained via optical model calculations. Finally experimental angular distributions were analysed by phase shift analysis and the problem of unicity and ambiguities of the scattering matrix S(l) was discussed. (author).

46522 (INIS-BR–1595) **Experimental investigation of quadrupole virtual photon spectrum.** Gouffon, P. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1986. 99p. (In Portuguese). Order

Number DE89635991/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

To test experimentally the quadrupole virtual photon spectrum calculation, the (e,α) excitation function of an isolated 2^+ level at 20.14 MeV in ^{24}Mg was measured. The most recent calculations in DWBA, including nuclear size effects, are compared to this experimental curve. The differential cross section $d^2\sigma/d\Omega dE$ was measured 48^0, 90^0, 132^0 in the laboratory system, for total electron energies of 20.0, 20.8, 21.5, 24.0, 26.0, 28.0, 30.0, 32.0, 36.0, and 40.0 MeV. The reduced matrix element B(E2) of the 20,14 MeV level is extracted as a secondary product of this work. (author).

Yadernykh Issledovanij); Grebnev, A.V.; Pshenichnyj, V.A.; Andzhevski, Yu.; Gledenov, Yu.M.; Zvarova, T.S.; Mitrikov, M.P.; Popov, Yu.P.; Salatskij, V.I.; Zuan, V.Z. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); AN SSSR, Moscow (USSR); AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij. 1988. (In Russian). (CONF-870959–: 1. international conference on neutron physics, 14-18 Sep 1987). In *Neutron physics. Vol. 2.* Order Number DE89012115/JAW. Available from NTIS (US Sales Only), PC A16/MF A01; INIS.

The thermal cross section of the (n,p) reaction on the radiactive nucleus ^{36}Cl was measured for the first time. The ionization chamber with two grids was used for identification and spectrometry of low-energy protons. The thermal cross section is found to be equal to (0.4+-0.1) b. 5 refs.; 2 figs.

46524 Small angle correlations in low energy heavy ion reactions: Emission time scales. Gordon, M. (SUNY, Stony Brook (USA)); Gilfoyle, G.P.; Xiuqin Lu; de Castro Rizzo, D.M.; Auger, G.; Kox, S.; Vax, L.C.; Alexander, J.M.; McGrath, R.L.; DeYoung, P.A.; Gelderloos, C.J.; Kortering, D.; Sarafa, J.; Kovar, D.G.; Vineyard, M.F.; Beck, C. pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

Light particles (p, d, α) have been studied (both singles and two-fold coincidences) from the reactions 80, 140, and 215 MeV ^{16}O + ^{27}Al. Singles data indicate evaporation-like emission for laboratory angles greater than about 50° (lab). Small angle correlations measured here of p-p (at the lower two energies), p-d, and d-d suggest long-range Coulomb forces dominate the interactions. Comparison to a trajectory model implies particle emission times of a few x 10^{-21} s at 140 MeV. In contrast, p-α, d-α, and α-α correlations have peaks associated with the short-range nuclear force. By comparing coincidence yields for detector pairs having $\Delta\phi \approx 0$ and $\approx 180°$ azimuthal separation, and by exploiting compound nucleus decay symmetries, we argue these latter correlations are due to decay of preformed, metastable resonances and are therefore insensitive to lifetime effects. All correlations become stronger with increasing energy.

The double beta decay is a quite useful tool to explore the nature of neutrino, but also powerful to explore the nature of particles which are hard to be explored by other experiments. One of the example is the exploration of the mass of Zino which is the superpartner of Z. I discuss how to achive this in the double beta decay experiment. Also I discuss the recent development of the double beta decay both from theoretical and experimental view point. (author).

Recent results from β-delayed proton and γ-decay studies of the N=81 precursors ^{147}Dy and ^{149}Er are presented. Proton emission proceeds from highly excited states in the N=82 β-decay daughters ^{147}Tb and ^{149}Ho to the ground-states of ^{146}Gd and ^{148}Dy, respectively. First results on overlapping proton and γ-ray spectroscopy, i.e. observation of competitive deexcitation of high-lying levels by proton and γ-ray emission are discussed for ^{147}Dy. Our results for ^{149}Er include the identification of the $\nu h_{11}2/^{-1}$M4 isomer and the five low-lying proton single particle states in the β-decay daughter ^{149}Ho. 13 refs., 8 figs. (author).

46529 (ORNL–6561) **Neutron capture of ^{122}Te, ^{123}Te, ^{124}Te, ^{125}Te, and ^{126}Te.** Macklin, R.L.; Winters, R.R. Oak Ridge National Lab., TN (USA). Jul 1989. 40p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89015682/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Isotopically enriched samples of the tellurium isotopes from mass 122 to mass 126 were used to measure neutron capture in the energy range 2.6 keV to 600 keV at the Oak Ridge Electron Linear Accelerator pulsed neutron source. Starting at 2.6 keV, over 200 Breit-Wigner resonances for each isotope were used to describe the capture data. Least-squares adjustment gave parameters and their uncertainties for a total of 1659 resonances. Capture cross sections averaged over Maxwellian neutron distributions with temperatures ranging from kT = 5 keV to kT = 100 keV were derived for comparison with stellar nucleosynthesis calculations. For the three isotopes shielded from the astrophysical r-process, ^{122}Te, ^{123}Te and ^{124}Te at kT = 30 keV the respective values were (280 $\pm$ 10) mb, (819 $\pm$ 30) mb and (154 $\pm$ 6) mb. The corresponding products of cross section and solar system abundance are nearly equal in close agreement

with s-process nucleosynthesis calculations. 26 refs., 8 figs., 10 tabs.

46530 Nuclear shapes from charged-particle γ-ray angular correlations. Nicolis, N.G. (Washington Univ., St. Louis, MO (USA)); Griffin, H.C.; Sarantites, D.G.; Adler, L.; Majka, Z.; Sobotka, L.G.; Semkow, T.M.; Beene, J.R.; Halbert, M.L.; Hensley, D.C.; Natowitz, J.B.; Schmitt, R.P.; Fabino, D.; Nebbia, G.; Mouthaty, G. pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

Alpha-particle and proton-angular distributions with respect to the spin direction have been measured following heavy ion fusion reactions. The energy dependence of the associated anisotropies systems studied were ^{110}Sn (94 MeV), ^{114}Sn (80 MeV), ^{138}Nd (82 MeV), ^{164}Yb (67 MeV), and ^{174}Yb (135 MeV). Distinct differences were found between these systems, suggesting near spherical behavior for the Sn systems, smaller deformations for ^{164}Yb and ^{138}Nd, and larger deformation for ^{174}Yb. These trends are compared with similar results from giant dipole resonances built on excited states. Recent results of proton spectra leading to superdeformed ^{148}Gd states observed in a 4π arrangement will be discussed.

46531 Complex fragments emitted in particle-stable states for the ^{32}S+^{nat}Ag reaction at E/A=22.3 MeV. Xu, H. M. (Department of Physics and Astronomy, Department of Chemistry, and National Superconducting Cyclotron Laboratory, Michigan State University, East Lansing, Michigan 48824(US)); Lynch, W. G.; Gelbke, C. K.; Tsang, M. B.; Fields, D. J.; Maier, M. R. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(1): 186-210 (Jul 1989). DOE Contract AC05-84OR21400.

The emission of complex fragments was studied for ^{32}S-induced reactions on ^{nat}Ag at E/A=22.3 MeV for angles back of the grazing angle, θ_{IMF}=20°–50°. The measured fragment kineticenergy spectra peak at energies near the exit channel Coulomb barriers anddecrease exponentially at higher energies. The angular distributions areforward peaked, indicating emission prior to the attainment of full statisticalequilibrium of the composite system. The relative populations of a large numberof particle stable states of these fragments were measured with a spinspectrometer. Comparisons with statistical calculations which include feedingfrom known discrete particle unbound states and high-lying continuum statesindicate emission temperatures of about 3–4 MeV.

46532 (GANIL-P–88-14) **Observation of new neutron rich nuclei ^{29}F, ^{35}Mg, ^{36}Mg, ^{38}Al, ^{39}Al, ^{40}Si, ^{41}Si, ^{43}P, ^{44}P, ^{45}S, ^{47}S, ^{46}Cl, ^{49}Cl and ^{48}Ar, ^{51}Ar from the interactions of 55 MeV/u ^{48}Ca + Ta.** Guillemaud-Mueller, D.; Anne, R.; Bazin, D.; Detraz, C.; Guerreau, D.; Jiang, D.X.; Mueller, A.C.; Saint-Laurent, M.G.; Borrel, V.; Jacmart, J.C. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1988. 10p. Order Number DE89908210/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

After magnetic separation, identification through time of flight and δE x E measurements has allowed the observation of the new nuclei, ^{29}F, ^{35}Mg, ^{36}Mg, ^{38}Al, ^{39}Al, ^{40}Si, ^{41}Si, ^{43}P, ^{44}P, ^{45}S, ^{46}S, ^{47}S, ^{46}Cl, ^{47}Cl, ^{48}Cl, ^{49}Cl, ^{49}Ar, ^{50}Ar ^{51}Ar from the interaction of a ^{48}Ca beam of 55 MeV/u with tantalum targets.

46533 Nuclear structure at moderate temperature. Holzmann, R. (GSI, Darmstadt (Germany, F.R.)). pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

Over the last years the properties of nuclei with A $\approx$ 150 have been studied extensively in discrete-line γ-ray spectroscopy as a function of both spin and ground-state deformation. Conversely, the evolution of nuclear structure with changing temperature remains largely unexplored. Hot nuclei provide opportunities to investigate new facets of physics, like shape changes, thermal shape fluctuations and the melting of shell effects. These phenomena, manifestations of a phase transition, are best accessible through measurements of the γ-ray quasicontinuum. This talk will present a study of the continuum properties of ^{152,154,156}Dy done at the Argonne-Notre Dame γ-ray facility. The three nuclei display a pronounced E2 component, which shows in ^{154}Dy an unexpected splitting into two parts, signifying a structural change along the γ-cascade at moderate temperature. Most of the observed features can be reproduced in statistical model calculations.

46534 Heavy-ion induced transfer reactions as a probe of high-spin collective states in nuclei. Cline, D. (Univ. of Rochester, NY (USA)). pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

Strong collective excitation inherent to heavy-ion reactions implies that one and two nucleon transfer can be induced between high-spin collective states. Studies using Ni, Sn and Pb beams with Sn, Dy and U targets have shown: (1) transfer reactions comprise a major fraction of the reaction cross section near the Coulomb barrier; (2) these reactions populate states to spin 30 in the yrast domain of the product nuclei, providing a means of populating high-spin states in transuranic nuclei unperturbed by the fission decay channel; (3) the coincident deexcitation gamma spectra are clean; (4) two-neutron transfer to the ground band exhibits an oscillatory dependence on separation distance and is enhanced by up to a factor of 500 at the largest separation distances. The feasibility of studying single-particle and pairing degrees of freedom at high spin and nuclear analogs of solid-state pairing effects will be discussed.

46535 Doorway-state formation and structure in β-delayed proton decay. Nitschke, J. M. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720 and Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831(US)); Wilmarth, P. A.; Firestone, R. B.; Moller, P.; Toth, K. S.; Gilat, J. *Physical Review Letters (USA)*, 62(24): 2805-2808 (12 Jun 1989). DOE Contract AC03-76SF00098;AC05-84OR21400.

The structure in the β-delayed proton spectra of the precursors $^{1}_{66}{}^{47}$Dy^{g}, $^{1}_{68}{}^{49}$Er^{g}, and $^{1}_{70}{}^{51}$Yb^{g} is analyzed within the framework of a doorway-state model. Indications from γ-ray decay studies, β strength-function measurements, and calculations of state densities and Gamow-Teller strength distributions, lead us to suggest that some of the observed proton transitions arise from the preequilibrium decay of doorway states populated in β^+ decay or electron capture.

46536 Gamma decay studies of giant resonances. Beene, J.R. (Oak Ridge National Lab., TN (USA)). pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). DOE Contract AC05-84OR21400. (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

Experiments on γ decay of GR in ^{208}Pb, ^{209}Bi, and ^{90}Zr excited by inelastic scattering of 22 and 84 MeV/nucleon ^{17}O will be reviewed. Nuclear structure information obtained from decays to the ground state (γ_0) and low lying excited states will be discussed, and processes contributing to γ_0 emission considered. At 84 MeV/nucleon, Coulomb excitation of GR is significant, enabling isovector resonances to be excited strongly, and providing a sensitive probe of the neutron-proton character of predominantly isoscalar resonances via Coulomb-nuclear interference. Ground state γ coincidence information is important in constraining the decomposition of singles data into individual resonances. The properties of the isovector quadrupole resonance in ^{208}Pb obtained from ^{17}O-γ-γ coincidences will be discussed.

46537 Transfer reactions with heavy deformed nuclei. Landowne, S. (Argonne National Lab., IL (USA)); Price, C.; Esbensen, H. pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). DOE Contract W-31-109-ENG-38. (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

Transfer reactions induced with heavy deformed nuclei depend, in principle, on particle correlations in nuclear systems that are rotating with significant amounts of angular momentum. As such, they are unique probes of nuclear structure. These types of reactions are also, in general, very difficult to measure and to analyze, which accounts for the fact that little research has been carried out on them, either experimentally or theoretically. During the last year new ideas and techniques have been developed which open up this field on the theoretical side, allowing detailed calculations to be carried out. For example, the reaction ^{162}Dy (^{208}Pb, ^{210}Pb)^{160}Dy has been modeled for bombarding energies above the Coulomb barrier. Differential cross sections are calculated for members of the ground state rotational band up to the spin I = 26^{+} state. The characteristic features of such reactions will be discussed, as well as applications to the diabolic transfer process and to cases that involve collisions of two heavy deformed nuclei.

46538 (AD-A-208071/1/XAB) **Proof of the feasibility of coherent and incoherent schemes for pumping a gamma-ray laser. Quarterly technical progress report, 1 January-31 March 1989.** Collins, C.B. Texas Univ., Richardson, TX (USA). Center for Quantum Electronics and Applications. Apr 1989. 69p. (GRL-8804). Available from NTIS, PC A04/MF A01.

Recent approaches to the problem of the gamma-ray laser have focused upon up-conversion techniques in which metastable nuclei are pumped with long-wavelength radiation. At the nuclear level the storage of energy can approach tera-Joules 10^{12} per liter for thousands of years. This report focuses on an approach to the gamma-ray laser that depends upon incoherent pumping. This nuclear analog of the ruby laser embodies the simplest concept for a gamma-ray laser and it is not surprising that the greatest rate of achievement toward a sub-Angstrom laser has continued in this direction. Emphasis has remained upon the giant pumping resonances that enabled dumping populations of the only available sample of the 29 candidates, Ta 180_m, through a cross section that was 10,000 times more favorable than even the most optimistic estimates. The lessons taught by that major milestone have been extended throughout the region of mass-180 nuclides. Reported is the success in pumping of only two of the candidates that are accidentally available, together with 17 other comparison isomers with the bremsstrahlung x rays from a MeV linac. Previous excitations of the giant resonances pumping these materials had been made with a continum of photon energies reaching to 6 MeV and concern had lingered that the full 6 MeV of energy might have been actually needed. At such values the density of nuclear states is high and the onset of evaporation of particles from nuclei is near. Either would make the resonances useless to laser development. The significance of this work is that neither detrimental effect can occur at energies as low as the value of 4 MeV at which performance has now been achieved.

46539 (CONF-890583-3) **Monte Carlo studies of nuclei and quantum liquid drops.** Pandharipande, V.R.; Pieper, S.C. Argonne National Lab., IL (USA). 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From Symposium on the occasion of the 40th anniversary of the nuclear shell model; 25-27 May 1989. Order Number DE89016914/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The progress in application of variational and Green's function Monte Carlo methods to nuclei is reviewed. The nature of single-particle orbitals in correlated quantum liquid drops is discussed, and it is suggested that the difference between quasi-particle and mean-field orbitals may be of importance in nuclear structure physics. 27 refs., 7 figs., 2 tabs.

46540 (CONF-890826-1) **Low-energy heavy-ion reactions: Some recent developments.** Satchler, G.R. Oak Ridge National Lab., TN (USA). [1989]. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From International nuclear physics conference; 20-26 Aug 1989. Order Number DE89016850/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We address three areas: behavior of the optical model at low energies and associated phenomena, fusion at near- and sub-barrier energies; where does fusion occur?, and recent examples of explicit coupled-channels effects at low energies. 74 refs., 18 figs.

46541 (CONF-890826-2) **Giant resonances: Progress, new directions, new challenges.** Bertrand, J.R.; Beene, J.R. Oak Ridge National Lab., TN (USA). 1989. 40p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From International nuclear physics conference; 20-26 Aug 1989. Order Number DE89017243/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A review of some recent developments in the field of giant multipole resonances is presented. Particular emphasis is placed on directions that the authors feel will be followed in this field during the next several years. In particular, the use of high-energy heavy ions to excite the giant resonances is shown to provide exciting new capabilities for giant resonance studies. Among subjects covered are: Coulomb excitation of giant resonances, photon decay of giant resonances, the recent controversy over the identity of the giant monopole resonance, the most recent value for incompressibility of nuclear matter from analysis of giant monopole data, the isospin character of the 63 $A^{-1/3}$ GQR, agreement between (e,e') and (hadron, hadron') excitation of the giant quadrupole resonance, prospects for multiphonon giant resonance observation, and isolation of the isovector giant quadrupole resonance. 55 refs., 23 figs., 4 tabs.

46542 (CONF-8905156-3) **A dynamical model of pion photoproduction on the nucleon and its applications.** Lee, T.-S.H. Argonne National Lab., IL (USA). [1989]. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract W-31109-ENG-38. From International Centre for Theoretical Physics conference; 22-26 May 1989. Order Number DE89016915/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

A dynamical model of pion photo-production on the nucleon is presented. Its extension to higher energies and application in the study of d(γ,p)n are discussed. 4 refs., 4 figs.

46543 (CONF-8908129-1) **Heavy-ion scattering near the Coulomb barrier: Some recent developments.** Satchler, G.R. Oak Ridge National Lab., TN (USA). [1989]. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 12. workshop on nuclear physics; 28 Aug - 1 sep 1989. Order Number DE89016849/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This paper discusses heavy-ion scattering near the Coulomb barrier with threshold anomalies and discusses the optical model for fusion. 37 refs., 18 figs. (LSP)

46544 (DOE/ER/40048-223-L9) **Fission Isomers.** Vandenbosch, R. Washington Univ., Seattle, WA (USA). Nuclear Physics Lab. [1989]. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-81ER40048. Order Number DE89017318/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The single particle (shell) effects giving rise to spontaneously fissioning shape isomeric states are outlined. Empirical data on static properties such as excitation energies and barrier heights are reviewed and compared with potential energy surface calculations. Half-life and branching ratio information are related to barrier penetration. Spectroscopic information on moments of inertia, quadrupole moments, spins and g-factors are reviewed. Recent developments on shape isomerism in other regions of the Chart of the Nuclides are presented. 22 refs., 5 figs.

46545 (DOE/ER/40048-225-L9) **Nuclear fission: What have we learned in 50 years?.** Vandenbosch, R. Washington Univ., Seattle, WA (USA). 1989. 22p. Sponsored by U.S. DOE Energy

Research. DOE Contract AC06-81ER40048. (CONF-890491--8: International conference on fifty years of research in nuclear fission, 3-7 Apr 1989). Order Number DE89017310/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Nuclear fission has captured the imagination of chemists and physicists for half a century now. There are several reasons for this. One of course is that it represents the most drastic rearrangement of nuclear matter known, challenged only recently by collisions induced by very heavy ions. Another is that both statistical and dynamical features come into play. Perhaps one of the most compelling reasons is its never-ending capacity to surprise us: asymmetric mass distributions, the sawtooth dependence of neutron yields in fragment mass, spontaneously fissioning isomers and intermediate structure resonances. Finally, and perhaps most importantly, fission is a rich laboratory within which one can explore the delicate interplay between the macroscopic aspects of bulk nuclear matter and the quantal effects of a finite number of Fermions. It will of course be impossible for me to cover all aspects of fission. I have chosen a limited number of topics to cover, with particular topics being chosen either because the have been associated with persistent puzzles in fission or because they have, or hopefully will, tell us something special about how nuclei behave. After a brief historical note, I organize these topics sequentially according to the various stages of the fission process, starting first with the probability for fission to occur and ending with scission phenomena. 56 refs., 11 figs.

46546 (DOE/ER/40316--3) **Studies of complex fragment emission in heavy ion reactions: Progress report, September 1, 1988 through August 31, 1989.** Sobotka, L.G. Washington Univ., St. Louis, MO (USA). Dept. of Chemistry. [1989]. 44p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER40316. Order Number DE89016470/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The production of large fragments, fragments with mass between light particles and fission fragments, in intermediate and high energy nuclear reactions has fostered the proposal of a number of novel reaction mechanisms. These include liquid-vapor equilibrium and nuclear shattering. Temporarily left in the wake of these exciting proposed mechanisms was the old standard, statistical decay of compound nuclei. To be sure, the standard treatment of compound nucleus decay did not deal with large fragment production. However, this omission was not due to any fundamental deficiency of statistical models, but rather an uncertainty concerning exactly how to splice large fragment emission into statistical models. A large portion of our program deals with this problem. Specifically, by studying the yields of large fragments produced in sufficiently low energy reactions we are attempting to deduce the asymmetry and l-wave dependence of large fragment emission from compound nuclear intermediates. This, however, is only half of the problem. Since the novel mechanisms proposed for large fragment emission were spawned by intermediate and high energy reaction data, we must also realize the relevance of the compound nucleus mechanisms at high energies. It is not unreasonable to suspect that compound nucleus-like objects are formed with less than complete momentum transfer and perhaps less than complete mass transfer. Therefore the study of energy, mass, and angular momentum transfer in incomplete fusion and non-compound reactions. This thread joins the apparently divergent subjects covered in this report.

46547 (DOE/ER/40334--4) **Nuclear excitations and reaction mechanisms: Progress report, [1 August 1988--31 July 1989].** Fallieros, S.; Levin, F.S. Brown Univ., Providence, RI (USA). Dept. of Physics. 1 Aug 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER40334. Order Number DE89016573/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

This Progress Report describes the work of the Brown University Nuclear Theory Group for the period 1 August 1988--31 July 1989 under Grant FG02-87ER40334. Completed and on-going research includes various theoretical and numerical studies on: virtual photons, electric polarizability, the Cabibo-Radicati sum rule, photon scattering, electron scattering, electron scattering sum rules, muon catalyzed fusion, few body collisions and breakup phenomena. Since it accompanies the three-year Renewal Proposal of the Group, it goes into more detail than our typical one-year reports.

46548 (GSI--89-16) **The role of the viscosity in the hydrodynamic model of high-energetic heavy ion reactions.** Schmidt, W. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Frankfurt Univ. (Germany, F.R.). May 1989. 119p. (In German). Order Number DE89915118/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

In the framework of the study of the properties of strong interactions by means of the thermodynamics of strongly compressed and highly excited nuclear matter as it is produced in relativistic heavy-ion reaction the author considers the hydrodynamic model for such reactions. The viscosity and the thermodynamic properties are derived by means of quantum statistical mechanics. Then the transverse-momentum and rapidity distributions are calculated in this framework. Some calculational results are presented for Au+Au collisions at 200 MeV/N and 400 MeV/N are presented. (HSI).

46549 (GSI--89-50(prepr.)) **The nuclear equation of state in effective relativistic field theories and pion yields in heavy-ion collisions.** Schoenhofen, M.; Cubero, M.; Gering, M.; Sambataro, M.; Feldmeier, H.; Noerenberg, W. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.). Jun 1989. 35p. Order Number DE89915141/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Within the framework of relativistic field theory for nucleons, deltas, scalar and vector mesons, a systematic study of the nuclear equation of state and its relation to pion yields in heavy-ion collisions is presented. Not the compressibility but the effective nucleon mass at normal nuclear density turns out to be the most sensitive parameter. Effects from vaccum fluctuations are well modelled within the mean-field no-sea approximation by self-interaction terms for the scalar meson field. Incomplete thermalization in the fireball may be the reason for the low pion yields observed in heavy-ion collisions. (orig.).

46550 (GSI--89-52(prepr.)) **The independent quark-gluon string model for heavy-ion collisions at ultrarelativistic energies.** Toneev, V.D.; Amelin, N.S.; Gudima, K.K. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.). Jun 1989. 17p. Order Number DE89915140/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

A dynamical model of independent quark-gluon strings is formulated for ultrarelativistic nuclear collisions. The formation and fragmentation of the strings are described in terms of the dual parton model. The consideration of the nuclear interaction is based on a coupled system of relativistic Boltzmann-like kinetic equations including the concept of the hadron formation time. The evolution of energy and baryonic densities is discussed for central O+Au collisions. The calculated characteristics for both the central and fragmentation rapidity region are compared with the recent CERN experimental data to disentangle the contributions of different nuclear effects. (orig.).

46551 (INDC(CSR)--016/LJ) **PEQAG: A PC version of fully pre-equilibrium computer code with gamma emission.** Betak, E. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jun 1989. 26p. Order Number DE89635977/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

This work has been performed under IAEA CRP on "Development of Improved Formalism in the Frame of Pre-equilibrium/compound Nuclear Reaction Theory and Code for Particle and Gamma Emission Spectra at Medium Excitation Energies" and research contract No. 5148/RB.

A PC version for exciton model calculation of angle-integrated nucleon and γ energy spectra is presented. All the emissions are treated consistently within the pre-equilibrium approach based on the master equations of the model and multiple particle and/or multiple γ emissions are included. 11 refs.

46552 (INDC(GDR)--054/LJ) **Statistical multistep reactions: application.** Kalka, H.; Torjman, M.; Seeliger, D. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jun 1989. 33p. Order Number DE89635978/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Work was performed under Research Agreement in the frame of the IAEA CRP on Methods for the Calculation of Fast Neutron Nuclear Data for Structural Materials of Fast and Fusion Reactors.

A model for statistical multistep direct and multistep compound reactions is presented. It predicts (double-differential) neutron and proton spectra including equilibrium, preequilibrium, direct (collective and non-collective) as well as multiple particle emission processes. Calculations for nucleon-induced reactions has been performed for about 30 nuclei at incident energies between 5 and 26 MeV without any parameter fit. (author). 48 refs, 9 figs, 1 tab.

46553 (INDC(NDS)–215/LJ) **Nuclear data for structural materials of fission and fusion reactors. Summary of the second research coordination meeting on methods for the calculation of fast neutron data for structural materials held in Vienna, 15-17 February 1988.** Goulo, V. (ed.). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jun 1989. 27p. Order Number DE89635979/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The document presents the status of nuclear reaction theory concerning optical model development, level density models and pre-equilibrium and direct processes used in calculation of neutron nuclear data for structural materials of fission and fusion reactors. 6 refs.

46554 (INIS-BR–1562) **Solitons in Gross-Pitaevskii equation.** Lopes, E. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1985. 61p. (In Portuguese). Order Number DE89635967/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

It is observed that, when the potential is integrable and repulsive, the Gross-Pitaevskii Equation, with non-vanishing boundary conditions, describes a family of planar solitons. A method is presented which provides an exact soliton field to the Dirac Delta potential and an approximation solution to any other kind of potential. As an example the method is then applied to the case of a repulsive Yukawa potential. A brief discuss the relation between these solitons and Anderson's superfluidity mechanism, is also presented. (author).

46555 (INIS-BR–1563) **Semiclassical treatment of correlation energy for nuclear systems.** Nielsen, M. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1988. 137p. (In Portuguese). Order Number DE89635968/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Starting with the separation of the many-body density operator in two parts, one describing the one-body aspects of the full density and the other containing all dynamic correlations information, the semiclassical approximation for the system correlation energy, was calculated. It is shown that, in this case, the Gaussian Wave Packets Phase Space Representation is more convenient than the Wely-Wigner Rrepresentation for the analysis of the semiclassical correlation energy. Using a phenomenological interaction, the correlation energy to the nuclear matter and some simmetric finite nucleus was calculated. The Fermi Surface Diffusivity, was also calculated. Finally, from the relation between this theory and the pertubation theory, we have done some considerations about the viability on the local densities expansion for energy functionals. (author).

46556 (INIS-BR–1565) **Symplectic collective model and its submodels.** Santos Avancini, S. dos. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1986. 129p. (In Portuguese). Order Number DE89635969/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

A review the symplectic collective model (SCM), emphasizing the mathematical and physical content of the model is done. Since the SCM is not computationally viable, a detailed discussion of the properties and relationships of the SCM submodels both, in a spherical and in a deformed harmonic oscillator basis is presented. It is shown that the deformed basis is an optimal one, from an analysis of the variational models, variation before projection (VBP) and variation after projection (VAP). To demonstrate that a calculation in the deformed basis is feasible, the submodel Sp paral. (1,R) x Sp perpend. (1,R) to calculate matrix elements of the operators of physical interest in ^{8}Be is considered. The Sp (1,R) x Sp_1 (1,R) is the simplest submodel which contains the states of VBP and VAP. (author).

46557 (INIS-BR–1568) **Determination of kinetic coefficients for proton-nucleus collisions at high energy.** Rizzato, C.M. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1987. 64p. (In Portuguese). Order Number DE89635980/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

From the effective proton dynamics, the approximations in the context of high energy collisions which lead to the Boltzmann equation, are established. From this equation, general expressions for the kinetic coefficients are deduced. Using a simple model, analytical expressions for kinetic coefficients are obtained. The importance of the effect of Pauli blocking is also shown. (author).

46558 (KFK–4565) **A prior-form distorted wave Born approximation analysis of the elastic break-up of 156 MeV ^{6}Li projectiles.** Srivastava, D.K.; Rebel, H.; Heide, N. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik. Jun 1989. 37p. Order Number DE89915122/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Features of the prior-form distorted wave Born approximation theory of elastic break-up of 156 MeV ^{6}Li ions scattered off ^{208}Pb are investigated. Nuclear breakup for large relative energies of the outgoing α-particle and deuteron fragments ($E_{\alpha d}$>5 MeV) studied here is found to proceed dominantly via the quadrupole scattering state of the α+d system when transition potentials from elastic fragment-target scattering are used for the calculations. The coherent contributions of different multipole components to the triple differential cross-sections appear to be very sensitive to the potentials generating the distorted waves and representing the cluster fragment-target interactions. The results of the analysis of the experimental data require transition potentials rather different from the on-the-mass shell optical potentials deduced from elastic α-particle and deuteron scattering. (orig.).

46559 (KFKI–1989-18/A) **Liquid layer model for non-magic nuclei.** Bastrukov, S.I.; Kluge, Gy.; Tarakanov, A.V. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Mar 1989. 20p. Order Number DE89635970/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A liquid layer model (LLM) is developed for studying the low-energy oscillations of non-magic spherical nuclei. It is assumed that at low excitations only nucleons off the double-magic core take part in the collective motion. These nuclear states are modellized by the motion of a layer of homogeneously charged, incompressible, isotropic liquid around a solid, inert core. Inertia, stiffness and energies of the lowest quadrupole, octupole and hexadecapole excitations are calculated. A fairly good agreement between the calculated and experimental values are obtained in the validity regions of LLM, that is for near magic nuclei. (author) 29 refs.; 5 figs.

46560 (KFKI–1989-26/A) **On prompt fission neutrons.** Kluge, Gy. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. May 1989. 15p. Order Number DE89635984/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Results of calculations of prompt neutron emission characteristics are presented for the spontaneous fission of ^{252}Cf. The average number ν(A) and the average center of mass kinetic energy eta(A) of the neutrons as well as the total neutron spectra are calculated in terms of the fragment mass. The available excitation energies of the fragment pairs are the input data, divided between the fragments by a thermal equilibrium assumption taking into account the equilibrium statistical fluctuations too. The total angular and energy distributions in the laboratory frame are built up of those of the individual fragments. The evaporation calculations show that the high energy behaviour of the spectra is governed rather by the temperatures than by the details of the individual cascade spectrum forms. The experimental data are reproduced by the calculated ones fairly well, so there is no need for assuming existence of additional scission neutrons. (author) 24 refs.; 4 figs.

46561 (LA-UR–89-2505) **Green's Function Monte Carlo calculations of light nuclei.** Carlson, J. Los Alamos National Lab., NM (USA). [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8907127–2: 12. few body conference, 2-8 Jul 1989). Order Number DE89015295/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Recently, Green's Function Monte Carlo methods have been developed which enable one to perform exact calculations for the ground states of three and four body nuclei. These methods allow the alpha particle to be used as a testing ground for a variety of two- and three-nucleon interaction models, both in terms of their ground state energies and a variety of other ground state expectation values. We present a brief review of GFMC methods as applied to light nuclei, including recent improvements of the algorithm and a discussion of the prospects for the inclusion of momentum-dependent terms. We then discuss results for the ground state energy, one- and two-body density distributions, D-state probability, coulomb sum rule, and momentum distributions. The GFMC results are compared to experimental results and to variational Monte Carlo calculations. 27 refs., 5 figs., 1 tab.

46562 (LA-UR–89-2790) **Calculated alpha-induced thick-target neutron and radionuclide yields for $E_{\alpha} \leq$ 50 MeV.** Bozoian, M.; Perry, R.T.; Wilson, W.B. Los Alamos National Lab., NM (USA). 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8906186–4: Materials Research Society materials analysis workshop, 14-17 Jun 1989). Order Number DE89016977/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Thick-target yields for αs incident on elements $4 \leq Z \leq 15$ and $Z = 17$ have been calculated using the α stopping data of Ziegler with radionuclide production cross sections calculated with the GNASH code. Comparisons are made of the calculated cross sections with sparse measured data. Radionuclide production yields are tabulated at 5, 10, 20, 30, 40 and 50 MeV. 9 refs., 3 figs., 13 tabs.

46563 (LBL–27454) **BRANDEX: A FORTRAN/Pascal code to calculate the multiple binary splitting of an excited nucleus.** Knop, R.; Stokstad, R.G. Lawrence Berkeley Lab., CA (USA). May 1989. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE89016338/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

BRANDEX is a statistical calculation based on averages of physical distributions that will predict cross sections for particle coincidence channels resulting from the breakup of an excited nucleus through a sequential binary process. With minor modification, it can make predictions for an arbitrary nucleus, integrating over an arbitrary weighted range of excitation. An example is given for ^{16}O breakup using the experimentally obtained excitation energy distribution. 4 refs., 6 figs.

46564 (ORNL/TM–9179/R2) **Updated users' guide for SAMMY: Multilevel R-matrix fits to neutron data using Bayes' equation: Revision 2.** Larson, N.M. Oak Ridge National Lab., TN (USA). Jun 1989. 161p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89015659/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

In 1980 the multilevel multichannel R-matrix code SAMMY was released for use in analysis of neutron data at the Oak Ridge Electron Linear Accelerator. Since that time, SAMMY has undergone significant modifications: user-friendly options have been incorporated to streamline common operations and to protect a run from common user errors; the Reich-Moore formalism has been extended to include an optional logarithmic parameterization of the external R-matrix, for which any or all parameters may be varied; the ability to vary sample thickness, effective temperature, matching radius, and/or resolution-broadening parameters has been incorporated; to avoid loss of information (i.e., computer round-off errors) between runs, the "covariance file" now includes precise values for all variables; and unused but correlated variables may be included in the analysis. Because of these and earlier changes, the 1980 SAMMY manual is now hopelessly obsolete. This report is intended to be complete documentation for the current version of SAMMY. Its publication in looseleaf form will permit updates to the manual to be made concurrently with updates to the code itself, thus eliminating most of the time lag between update and documentation. 28 refs., 54 tabs.

46565 (ORNL/TM–11297) **URR [Unresolved Resonance Region] computer code: A code to calculate resonance neutron cross-section probability tables, Bondarenko self-shielding factors, and self-indication ratios for fissile and fertile nuclides.** Leal, L.C.; de Saussure, G.; Perez, R.B. Oak Ridge National Lab., TN (USA). 15 Aug 1989. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89016941/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The URR computer code has been developed to calculate cross-section probability tables, Bondarenko self-shielding factors, and self- indication ratios for fertile and fissile isotopes in the unresolved resonance region. Monte Carlo methods are utilized to select appropriate resonance parameters and to compute the cross sections at the desired reference energy. The neutron cross sections are calculated by the single-level Breit-Wigner formalism with s-, p-, and d-wave contributions. The cross-section probability tables are constructed by sampling the Doppler broadened cross-section. The various shelf-shielded factors are computed numerically as Lebesgue integrals over the cross-section probability tables. 6 refs.

46566 (UCRL–101175) **Experimental and theoretical studies of odd-odd deformed nuclei.** Hoff, R.W. Lawrence Livermore National Lab., CA (USA). 13 Jun 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8906168–3: International conference on selected topics in nuclear structure, 20-24 Jun 1989). Order Number DE89016512/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The application of a simple semi-empirical model is discussed in terms of interpreting experimental nuclear structure data for twelve of the best characterized odd-odd deformed nuclei. An essential part of this modeling is to calculate values for the Gallagher-Moszkowski splitting and Newby shifts, the observables that arise from the n-p residual interaction in odd-odd nuclei. Assumptions regarding the form for this n-p force are traced historically, beginning with a delta force and including finite-range central forces of various descriptions, the necessary introduction of a tensor force to allow proper calculation of certain Newby shifts, and the use of the Skyrme III interaction to determine the ingredients of a Bohr-Mottelson unified-model description through the Hartree-Fock-Bogolyubov approximation. The predictive power of a favored form of the n-p force, one that produced a remarkably good fit to E(G-M) data in 1976, is examined in light of experimental data obtained since its formulation. A data set of 42 experimentally determined Newby shifts has been reviewed as to the reliability of each entry. Exceptions to a recently proposed rule for the a priori determination of the sign of a Newby shift are discussed. Evidence is presented for the existence of odd-even staggering in the rotational spacings of many K^- bands (with $K>0$). By use of Coriolis-coupling calculations, it has been possible to reproduce the odd-even staggering observed in some of the K^- rotational bands of 168Tm, 176Lu, 182Ta, and 182Re. 26 refs., 2 figs., 3 tabs.

46567 The role of compound nuclei in intermediate energy heavy ion reactions. Moretto, L. (Lawrence Berkeley Lab., CA (USA)). pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

Hot compound nuclei are frequently produced in intermediate energy reactions through a variety of processes. At high excitation energies compound nuclei can decay by modes that are very improbable at lower energies. Thus complex fragments, high energy gamma rays and even pions can be emitted with sizeable probability. These emission are interesting on their own right, as they reflect the properties of nuclei near the limit of thermal instability, but they must also be considered as a potentially strong background to less conventional processes. In the case of gamma ray emission it will be shown that in a specific reaction all the gamma ray are attributable to compound emission rather than to nucleon-nucleon bremsstrahlung. Furthermore complex fragments unrelated to target and projectile are arising from compound binary decay up to 100 MevA rather than from liquid vapor equilibrium. Finally apparently high temperatures in pion spectra may be due to energy fluctuations between compound nuclei present in the exit channel.

46568 Decomposition of the total reaction cross section at energies around the coulomb barrier. Wolfs, F.L.H. (Argonne National Lab., IL (USA)). pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). DOE

Contract W-31-109-ENG-38. (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

The fusion yields observed in heavy-ion reactions around the Coulomb barrier are in general much larger than the yields calculated using simple barrier penetration models. This sub-barrier fusion enhancement has been interpreted in terms of a coupling between the elastic channel and other reaction channels which effectively lowers the fusion barrier. At Argonne we have studied the decomposition of the total reaction cross section at energies around the Coulomb barrier in great detail in order to establish the relative strength of the contributing reaction channels. These studies showed not only that the quasielastic scattering yields are the dominating contribution to the total reaction cross section, but also a considerable enhancement of deep-inelastic scattering compared to simple classical model estimates. Experiment and their relation to sub-barrier fusion are discussed.

46569 Heavy-ion reactions near and below the coulomb barrier. Esbensen, H. (Argonne National Lab., IL (USA)). pp. 16 of 196th ACS national meeting. American Chemical Society, Washington, DC (US) (1988). DOE Contract W-31-109-ENG-38. (CONF-8809241–: Symposium on the interface between nuclear structure and reactions, 25-30 Sep 1988).

The experimental knowledge of heavy-ion reactions near the Coulomb barrier has been improved considerably in the past decade. Cross sections and angular distributions for the most dominant reaction channels have been measured for several systems and one has observed large enhancements of subbarrier fusion cross sections compared to one-dimensional barrier penetration models. It has been an important issue to try to understand the interplay between the different reaction channels and, in particular, their influence on fusion and elastic scattering. The present understanding of this interplay is reviewed, and coupled-channels calculations that attempt to give a realistic description of the most dominant reaction channels are discussed.

46570 Coupled-channels calculations of elastic and inelastic scattering. Esbensen, H. (Physics Division, Argonne National Laboratory, Argonne, Illinois 60439(US)); Videbaek, F. *Physical Review [Section] C: Nuclear Physics (USA)*, 40(1): 126-131 (Jul 1989). DOE Contract W-31-109-ENG-38.

Cross sections for the elastic and inelastic scattering of ^{16}O on ^{58}Ni, ^{88}Sr, ^{40}Ca, and ^{48}Ca have been calculated in a coupled-channels treatment, including the low-lying 2^+ and 3^- states of both projectile and target. Real, energy-independent ion-ion potentials and form factors were used, and fusion was simulated by ingoing wave boundary conditions in all channels. The agreement with the measured scattering data is qualitatively as good as obtained in previous optical-model calculations.

(CONF-8710489–: 1. meeting of the standing conference on health and safety in the nuclear age, 5-7 Oct 1987). In *Health and safety in the nuclear age*. Order Number DE89908200/JAW. Available from NTIS (US Sales Only), PC A12/MF A01.

The aim of radiation protection is to protect individuals, their offspring and the population as a whole against harmful effects from ionizing radiation and radioactive substances. Harmful effects may be either somatic, i.e. occurring in the exposed person himself/herself, or hereditary, i.e. occurring in the exposed person's offspring. Successful radiation protection involves (a) protective measures based on the results of research into the biological and biophysical effects of radiation and (b) ensuring that activities necessitating exposure are justified and that the degree of exposure is minimal. This benefit/risk principle ceases to apply if a radiation source is out of control, since the main aim is then to introduce risk limitation measures, provided that these are of positive net benefit to the individual and the population as a whole. This paper discusses the principles of dose limitation as a function of exposure conditions, i.e. controlled or uncontrolled exposure to a source of radiation.

46573 (CONF-890426–27) **Diffusion, segregation, and recrystallization in high-dose ion-implanted Si.** Pennycook, S.J. Oak Ridge National Lab., TN (USA). Jul 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Spring meeting of the Materials Research Society; 24-28 Apr 1989. Order Number DE89016224/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Using the new technique of Z-contrast scanning transmission electron microscopy (STEM), we have been able to study the segregation of Sb at an advancing SPE growth interface and the resulting interface breakdown. The first direct information is obtained on Sb diffusion in the amorphous phase, which is many orders of magnitude enhanced over tracer crystalline values. This controls both the dopant incorporation and the stability of the resulting supersaturated alloy. These results are compared to the behavior of the low melting point substitutional diffusers and the interstitial diffusers. 23 refs., 8 figs.

46574 (CONF-890708–6) **Collisionally induced stochastic dynamics of fast ions in solids.** Burgdoerfer, J. Oak Ridge National Lab., TN (USA). [1989]. 11p. Sponsored by DOE/ER;NSF. DOE Contract AC05-84OR21400. From 16. international conference on the physics of electronic and atomic collisions; 26 Jul - 1 aug 1989. Order Number DE89015983/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Recent developments in the theory of excited state formation in collisions of fast highly charged ions with solids are reviewed. We discuss a classical transport theory employing Monte-Carlo sampling of solutions of a microscopic Langevin equation. Dynamical screening by the dielectric medium as well as multiple collisions are incorporated through the drift and stochastic forces in the Langevin equation. The close relationship between the extrinsically stochastic dynamics described by the Langevin and the intrinsic stochasticity in chaotic nonlinear dynamical systems is stressed. Comparison with experimental data and possible modification by quantum corrections are discussed. 49 refs., 11 figs.

46575 (CONF-890821–2) **Dielectronic excitation and recombination in crystal channels.** Datz, S.; Vane, C.R.; Dittner, P.F.; Giese, J.P.; Gomez del Campo, J.; Jones, N.L.; Krause, H.F.; Miller, P.D.; Schulz, M.; Schone, H.; Rosseel, T.M. Oak Ridge National Lab., TN (USA). 1989. 24p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. international conference on atomic collisions in solids; 7-11 Aug 1989. Order Number DE89016864/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Dielectronic excitation and recombination have been observed during the interaction of channeled ions (H-like S, Ca, and Ti and He-like Ti) with the electrons contained in ⟨110⟩ and ⟨100⟩ channels in Si. As in dielectronic recombination, the products of the reaction are an ion of reduced charge state and the emission of a photon(s). However, the high electron density in the channel introduces

collisional mechanisms for the destruction of the doubly excited intermediate state and even the formation of ions with increased charge state. The experiments prove that crystal channels may be treated quantitatively as a dense electron target for ions with velocity $v_i >> v_f$, the Fermi velocity of the electrons in the channel. 14 refs., 8 figs., 1 tab.

46576 Coherent excitations of nuclei in crystals by synchrotron radiation pulses. Trammell, G.T. (Rice Univ., Houston, TX (USA)); Hannon, J.P. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Synchrotron pulses will excite low lying nuclear levels, and in crystals, will create nuclear exciton states which are spatially coherent superpositions of the various excited state hyperfine levels of all the nuclei in the crystal. The subsequent radiative decay is radically affected by coherence, exhibiting both a speed-up due to coherent enhancement, and a quantum beat modulation of the decay rate which gives a periodic speed-up/slow-down of the rate for photon decay into the coherent channels. For a nuclear exciton in an antiferromagnet, the quantum beat modulation will result in an interesting temporal pendulosung effect. 22 refs.

46577 Nuclear Bragg diffraction using synchrotron radiation. Ruffer, R. (Universitaet Hamburg (Germany, F.R.)). pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Nuclear Bragg diffraction in combination with synchrotron radiation will become a powerful new x-ray source in the Å-region. This new source exceeds already Mossbauer sources in brilliance giving Mossbauer scattering experiments further impetus. With the planned dedicated storage rings synchrotron radiation, filtered by measures of the Mossbauer effect, will not only allow new types of Mossbauer experiments but offers also a new x-ray source for μeV resolution and long coherence length x-ray optics. The first experiments had shown that there is a resonance in the diffraction spectra and even that the diffracted x-rays are highly monochromatic. Although these experiments had shown the expected time behavior, an improved fast detector revealed the complete time spectra in all details. These experiments point out the basic phenomena connected with the nuclear Bragg diffraction of γ-quanta: speedup (coherent enhancement), quantum beats, and polarization mixing (Faraday rotation, etc.,). The speedup in the time spectra- a dynamical effect of the diffraction, depends on the angle of incidence and is most pronounced at the beginning of the time spectra. This is clearly and very easily seen in the measurements of the antiferromagnetic $^{57}FeBO_3$. In the quantum beats the hyperfine splitting of the nuclear levels and/or the resonance shifts between different nuclear sites in the crystal are expressed. The observation of quantum beats allows a sensitive and direct determination of the hyperfine interaction parameters. 2 refs.

46578 The production of long coherence-length hard x-rays using nuclear Bragg scattering of synchrotron radiation. Siddons, D.P. (Brookhaven National Lab., Upton, NY (USA)). pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Recently, several experimenters have successfully observed nuclear Bragg scattering from crystals containing ^{57}Fe. By coherently exciting the 14.4keV resonance at the Bragg condition, almost pure beams of extremely monochromatic radiation can be generated. Although the intensities observed are so far quite low, the brightness produced by these techniques exceeds that available from radioactive sources. Instrumental improvements will soon make possible interesting new experiments. Several properties of the nuclear Bragg reflection process are interesting in themselves. These include the observation of beating in the time domain among hyperfine split resonance lines, and polarization mixing produced by scattering from oriented circularly polarized oscillators. Some speculations on the potential applications of this new source of long coherence-length radiation will be presented.

46579 Studies of hot, solid materials produced by an ultrashort pulse laser. Milchberg, H.M. (Univ. of Maryland, College Park (USA)); Freeman, R.R. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

A series of ultrashort pulse laser-solid interaction experiments have been performed using copper and aluminum which illustrate charge transport properties of these strongly heated materials at near-solid density. In aluminum, as a drude metal at the laser wavelength, the transport is seen to be strongly dominated by collisions with the appearance of a minimum mean free path. In copper, band absorption of the laser light is seen to be a strong process even at $\sim$ 50 eV temperatures. In the context of using ultra-short pulse laser-produced plasmas as a source of ultra-short pulse soft x-rays, evidence is presented that heat loss mechanisms in these hot solids may not be sufficiently rapid to result in subpicosecond soft x-ray bursts. 5 refs., 4 figs.

46580 (CONF-8906155–5) **Annealing environment effects in solid-phase epitaxial regrowth of Fe-implanted Al_2O_3.** McCallum, J.C.; White, C.W.; Sklad, P.S.; McHargue, C.J. Oak Ridge National Lab., TN (USA). Jun 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Radiation effects in insulators-5: crystalline oxides and ceramics session; 19-23 Jun 1989. Order Number DE89016843/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Samples of c-axis Al_2O_3 were implanted with Fe(160 keV,4 x $10^{16}/cm^2$) at liquid nitrogen temperature and then thermally annealed at temperatures of 900,960 and 1100°C in an oxidising environment (flowing O_2) or in a reducing environment (flowing 96% Ar, 4% H). Rutherford backscattering spectrometry, ion channeling, and transmission electron microscopy of the crystals revealed differences in the annealing characteristics of the implanted layers that depended on the annealing environment. These results indicate the importance of the annealing atmosphere in determining the characteristics of epitaxially regrown layers in ion-implanted and thermally annealed Al_2O_3. 15 refs., 5 figs.

46581 (CONF-8906197–1) **Effects on ion implantation on intermediate range order: IR spectra of silica.** Magruder, R.H. III; Morgan, S.H.; Weeks, R.A.; Zuhr, R.A. Oak Ridge National Lab., TN (USA). 1989. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 10. university conference on glass science; 7-9 Jun 1989. Order Number DE89016081/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The reflectance spectra of ion unimplanted SiO_2 glass has been measured from 5000cm^{-1} to 400cm^{-1}. The silica was implanted with Ti, Cr, Mn, Fe, Cu and Bi to nominal doses ranging from 1 x 10^{15} ions/cm^2 to 1.2 x 10^{17} ions/cm^2 at an energy of 160 KeV and currents of approximately 2.6 μA/cm^2. Changes in the intensity of the 1232cm^{-1} and 1015cm^{-1} vibrational modes are attributed to changes in the intermediate range order and to changes in the concentration of non-bridging oxygen (NBO) defects in the implanted layer. These changes are ion and dose dependent. The differing effects on IRO and NBO are attributed to the chemical interaction of the implanted ions with the substrate. 23 refs., 5 figs., 2 tabs.

46582 (DOE/ER/10742–3) **Development of an x-ray beam line at the NSLS [National Sychrotron Light Source] for studies in materials science using x-ray absorption spectroscopy: Progress report.** Sayers, D.E. North Carolina State Univ., Raleigh, NC (USA). Dept. of Physics. 1988. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AS05-80ER10742. Order Number DE89016896/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

This paper briefly discusses progress on the beam lines at the National Synchrotron Light Source. Experiments on amorphous materials are also discussed. (LSP)

46583 (DOE/ER/45233–4) **Studies of ultrathin magnetic films and particle-surface interactions with spin-sensitive electron spectroscopies: Progress report, 1 January 1989–30 November 1989.** Walters, G.K.; Dunning, F.B. Rice Univ., Houston, TX (USA). Aug 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER45233. Order Number DE89016741/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Research during the fourth year of this grant has focused on: investigation of spin-exchange in electron scattering from nonmagnetic metallic surfaces by means of Spin-Polarized Electron Energy Loss Spectroscopy (SPEELS); and studies of magnetic properties of the Fe(110) surface, and the effect of an oxygen overlayer, utilizing Spin-Polarized Metastable Atom De-excitation Spectroscopy (SPMDS). 7 refs., 2 figs.

46584 (DOE/ER/45370–1) **Morphological analysis of ionomers: Progress report, August 1, 1988–March 31, 1989.** Wisconsin Univ., Madison, WI (USA). [1989]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER45370. Order Number DE89016023/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report discusses; small-angle x-ray scattering (ASAXS) from amorphous ionomers; ASAXS from semicrystalline ionomers; and polymer synthesis for proposed research. (LSP)

46585 (IC–88/412) **New type of surface acoustic waves in solids due to nonlinear elasticity.** Mozhaev, V.G. International Centre for Theoretical Physics, Trieste (Italy). Dec 1988. 8p. Order Number DE89635748/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

It is shown that in nonlinear elastic semi-infinite medium possessing a property of self focusing of shear waves, besides bulk non-linear shear waves, new surface acoustic waves exist, localization of which near the boundary is entirely due to nonlinear effects. (author). 8 refs.

46586 (IC–89/24) **Dipolar fluid-wall systems. Beyond the image potential.** Boudh-hir, M.E. International Centre for Theoretical Physics, Trieste (Italy). Feb 1989. 15p. Order Number DE89635749/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The case of dipolar fluid in front of an ideal wall is examined. The surface-fluid system is introduced as a limit case of a binary mixture Using the diagrammatic development, the expansion of the one-particle distribution function is given. 16 refs.

46587 (IC–89/25) **Pair distribution function in polar fluid-hard wall systems. Long range components.** Boudh-hir, M.E. International Centre for Theoretical Physics, Trieste (Italy). Feb 1989. 16p. Order Number DE89635750/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Using the diagrammatic technique we prove that the total correlation function for dipolar fluid systems in front of an ideal wall has four long range components. 21 refs.

46588 (IC–89/26) **New developments for localized adsorption.** Boudh-hir, M.E. International Centre for Theoretical Physics, Trieste (Italy). Feb 1989. 20p. Order Number DE89635751/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Using the diagrammatic expansion, new developments for localized adsorption are found. It is proved that the correlations in the system, in the absence of the attractive site potential, and the periodicity of the sites play a fundamental role in the adsorption phenomena. 14 refs, 2 figs, 2 tabs.

46589 (IC–89/29) **Anomalies of the longitudinal magnetothermoelectric power of metal in the vicinity of electronic topological transition.** Blanter, Ya.M.; Pantsulaya, A.V.; Varlamov, A.A. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 37p. Order Number DE89635763/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The longitudinal magnetothermoelectric power (MTEP) is calculated for metal in magnetic field and in the vicinity of electronic topological transition (ETT). The giant oscillations of MTEP as the function of applied magnetic field are found. These oscillations originate from the energy dependence of electron relaxation time in magnetic field and they are peculiar to any normal metal independently on the shape of its Fermi surface. Nevertheless the ETT essentially changes the form and magnitude of such oscillations. The results of recent experimental investigation of MTEP in cadmium monocrystals under the pressure and in magnetic field are discussed from the point of view of the theory presented. (author). 23 refs, 6 figs.

46590 (IC–89/37) **Freezing of Coulomb liquids.** Tosi, M.P. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 17p. Order Number DE89635752/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Recent progress in the theory of liquid-solid coexistence as approached from the liquid phase in systems with Coulomb forces is reviewed. Main attention is given to (i) Wigner crystallization of the electron gas in the degenerate and classical limits, and (ii) localization of bond particles leading to freezing in a pseudoclassical liquid-state version of the bond-charge model for elemental semiconductors. These models serve to illustrate crystallization driven by pure Coulomb repulsions and crystallization resulting from the interplay of attraction and repulsions in multicomponent systems, respectively. (author). 29 refs, 4 figs.

46591 (IC–89/75) **Thermodynamic studies on the ferroelectric phase transition in neutron irradiated $(Li_xK_{1-x})_2SO_4$ crystals at high temperature.** Kassem, M.E.; El-Khatib, A.M.; Ammar, E.A.; Denton, M.M. International Centre for Theoretical Physics, Trieste (Italy). May 1989. 14p. Order Number DE89635786/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Thermodynamic studies of $(Li_xK_{1-x})_2SO_4$, LKS, mixed crystals have been made in the concentration range (x=0.1,0.2,...,x=0.5). The thermal behavior has been investigated by differential thermal analysis, DTA, and differential scanning calorimeter, DSC, in the vicinity of high temperature phases. Also, the effect of the mixed neutron field of fast and thermal neutrons (10% of the reactor neutron pile is fast neutrons) on the thermal properties of mixed crystals was studied. The results showed a change in the transition temperature Tc, as well as the value of specific heat C_t at transition temperature, due to the change of stoichiometric ratio and radiation doses. The change of enthalpy and entropy of mixed crystals have been estimated numerically. The obtained small values of $\Delta S/R$ is characteristic of incommensurate phase transition as previously confirmed by the results of neutron diffraction technique. (author). 16 refs, 5 figs, 1 tab.

46592 (IC–89/76) **Fractal dimension of the fractured surface of materials.** Lung, C.W.; Zhang, S.Z. International Centre for Theoretical Physics, Trieste (Italy). May 1989. 11p. Order Number DE89635764/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Fractal dimension of the fractured surface of materials is discussed to show that the origin of the negative correlation between D_F and toughness lies in the method of fractal dimension measurement with perimeter-area relation and also in the physical mechanism of crack propagation. (author). 8 refs, 4 figs, 1 tab.

46593 (INIS-BR–1558) **Renormalization techniques applied to the study of density of states in disordered systems.** Ramirez Ibanez, J. Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica. 1985. 132p. (In Portuguese). Order Number DE89635765/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

A general scheme for real space renormalization of formal scattering theory is presented and applied to the calculation of density of states (DOS) in some finite width systems. This technique is extended in a self-consistent way, to the treatment of disordered and partially ordered chains. Numerical results of moments and DOS are presented in comparison with previous calculations. In addition, a self-consistent theory for the magnetic order problem in a Hubbard chain is derived and a parametric transition is observed. Properties of localization of the electronic states in disordered chains are studied through various decimation averaging techniques and using numerical simulations. (author).

46594 (INIS-BR–1560) **Vibrational properties of amorphous semiconductors.** Schulz, P.A.B. Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica. 1985. 67p. (In Portuguese). Order Number DE89635766/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

A model for the lattice dynamics of a-Si_{1-X} N_X is introduced. This model is based on a Born hamiltonian, solved in the Bethe lattice approximation. Starting from the local density of vibrational states, we analize the infrared absoption spectra of this material. (author).

46595 (INIS-BR–1567) **Pairs of chalcogen impurities in silicon.** Paula Junior, H.F. de. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1988. 109p. (In Portuguese). Order Number DE89635767/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

The electronic structure of complex defects in silicon involving oxygen and sulfur (O-O, S-O and S-S), occupying different positions in the host crystal is studied. It is shown that the many-electron effects (via configuration interaction) are important to describe the correct ground state. The orbital base set is obtained through the LCAO-MO-INDO/S method. (author).

46596 (INIS-BR–1583) **Carbon-13 nuclear magnetic resonance of heterocyclic salts and its precursors.** Freire, H.R. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1989. 92p. (In Portuguese). Order Number DE89635768/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

The synthesis of 1,2,3,6 - tetrahydro - 1, 1 dimethyl - 3 - oxo - 5 phenylpyridinium bromides containing the substituents: H, Me, Cl, Br, OMe and NO_2 is described. The phenacyl bromides (8a-f) were characterized by their melting points and by their I.r. and ^1H n.m.r. spectra. Some studies on ^{13}C n.m.r. spectra of the phenacyl bromides (8a-f), the quartenary ammonium salts (7a-f) and the cyclic salts(6a-f) are shown. The effect of substituents on the eletronic structure of these compounds and on the chemical shifts of the different carbon atoms in terms of electronic and steric effects are discussed. (M.J.C.).

46597 (INIS-BR–1587) **Study of $Tl^0(1)$ and $In^0(1)$ defects in alkaline halides: prototype of a color center as active laser medium.** Vieira Junior, N.D. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1986. 165p. (In Portuguese). Order Number DE89635769/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

The optical properties of the $Tl^0(1)$ and $In^0(1)$ centers in Kcl crystals in cation sites of the crystal lattice, perturbed by an adjacent anion vacancy. Emphasis is given to the lowest energy levels. Using a tagging optical absorption technique, the absorption bands were identified. The laser action of $Tl^0(1)$ center in KCl by pumping with Nd: YAG laser in the lowest energy absorption band was obtained. A simple way to achieve continuous single frequency laser operation using a grating as the sole tuning element is described. It is shown that, by proper choice of cavity parameters, the competing hole burning modes can be completely supressed. Experiments were carried out using $Tl^0(1)$ centers in KCl as the gain medium. The production of pulses via synchronous pumping of $Tl^0(1)$ color center in KCl are reported. (author).

46598 (INIS-BR–1588) **Magnetism of classical and quantum systems of localized spins.** Mariz, A.M. Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro, RJ (Brazil). 1985. 129p. (In Portuguese). Order Number DE89635770/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The static critical properties of localized are studied spin systems. Several models are discussed: (a) the anisotropic quantum Heisenberg ferromagnet on square lattice (with quenched bond-dilution and random anisotropy) and on simple cubic lattice; (b) the Z(4) ferromagnetic model on square lattice; (c) the Ising model on the Cayley tree, in the presence of competing interactions. The (a) and (b) problems are studied within a real-space Renormalisation Group (RG) approach. In both cases, methods to perform the relevant partial tracings, that are better than those available in the literature are developed. The critical frontiers obtained reproduce all known exact results, and they are high precision ones everywhere. Correlation lenght critical exponents (4u) and the crossover exponents (PHI) are also calculated. The values are, in degree of approximation, equal or superior to those obtained using the Migdal-Kadanoff RG. The (c) problem is investigated by constructing recursive relations (similar to RG); the resulting phase diagram (numerically exact) presents a set of modulated phases, besides the ferromagnetic, antiferromagnetic and paramagnetic ones. It is worth to stress the presence of metastability phenomena and the existence of the paramagnetic phase at arbitrary non-vanishing small temperatures. In addition to the previous works a study of the energy eigenvalues and the specific heat of a general anharmonic single quantum oscillator, by using the Turschner and WKB approximations was performed. Comparisons between them, exhibit the superiority of the Turschner approximation. (author).

46599 (INIS-BR–1591) **Preparation and spectrometric identification of amide derivatives with antimalaric.** Ferreira, E.J. Sao Paulo Univ., SP (Brazil). Inst. de Quimica. 1987. 423p. (In Portuguese). Order Number DE89635771/JAW. Available from NTIS (US Sales Only), PC A18/MF A01 - OSTI; INIS.

The structures of polymeric compounds using spectrometric analysis of infrared, ultraviolet and protonic magnetic resonance and ^{13}C nuclear magnetic resonance are studied. Some structural models are used such as antimalaric-sulfones and pyrimidinic derivatives, and non-polymeric derivatives of active compounds. A comparative analysis on structures less complexes is shown. (M.J.C.). Spectrums 186 p.

46600 (INIS-BR–1596) **Chalcogen donnors in silicon.** Scolfaro, L.M.R. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1985. 138p. (In Portuguese). Order Number DE89635772/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

The electronic stucture of chalcogen impurities in silicon which give rise to deep levels in the forbidden band gap of that semiconductor is studied. The molecular cluster model within the formalism of the multiple scattering method in the $X\alpha$ local density approximation was used . The surface orbitals were treated by using the Watson sphere model. Studies were carried out for the isolated substitutional sulfur and selenium impurities (Si:S and Si:Se). A pioneer investigation was performed for the nearest-neighbor impurity pairs of sulfur and selenium (Si:S_2 and Si:Se_2). All the systems were also analysed in the positive charge states (Si:S^+, Si:Se^+ and Si:Se_2^+) and for the isolated impurities the calculations were carried out to the spin polarized limit. The obtained results were used to interpret recent photoconductivity, photocapitance, EPR and DLTS data on these centers. It was observed that the adopted model is able to provide a satisfactory description of the electronic structure of the chalcogen impurity centers in silicon. (autor).

46601 (INIS-BR–1598) **Kinetic analysis of interstitial atomic hydrogen in a-Si:(H,O,N) and beryllia.** Furtado, W.W. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1986. 84p. (In Portuguese). Order Number DE89635787/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

A method for interpreting thermal decay of interstitial atomic hydrogen H^o_i produced by irradiation in a-Si: (H,O,N) and in beryllia was developed. The hypothesis of H^o_i were produced from RH type molecules by irradiation effect and trapped in the interstitials of studied elements was considered. The hypothesis of the heating causes the disarming of H^o_i, and can be retrapped, recombine with R matrices or react between themselves to form the H_2 molecules. The kinetic equations were arranged by a schematic method for each proposed reaction. These equations were solved numerically by RungeKutta method. The adjust parameters show that the H^o_i + H^o_i -> H_2 occurs only for beryllia, because the kinetic occurs at higher temperatures. All the parameters were adjusted to Arrhenius law, allowing to determine the activation energies for each process. (M.C.K.).

46602 (INIS-SU–92) **Physics and technique of millimeter and submillimeter waves.** AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Inst. Radiofiziki i Ehlektroniki. 1987. 49p. (In Russian). Available from NTIS (US Sales Only), PC A03/MF A01; INIS.

Individual papers are processed separately for the data base.

46603 (INIS-SU–92, pp. 3-7) **Resonance interaction of surface magnetoplasma polaritons in semiconductor layer.** Glukhov, O.V. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Inst.

Radiofiziki i Ehlektroniki. 1987. (In Russian). In *Physics and technique of millimeter and submillimeter waves.* Order Number DE89012210/JAW. Available from NTIS (US Sales Only), PC A03/MF A01; INIS.

Magnetoplasma polaritons in semiconductor layer with asymmetric dielectric surroundings are studied. Resonance interaction of surface magnetoplasma polaritons propagating on the opposite boundaries of the semiconductor layer is investigated. Quantitative criteria for the effect existence are determined.

46604 (INIS-SU–92, pp. 30-31) **Excitation of electromagnetic oscillations by charged particle flux in semiconductor plate.** Yakovenko, I.V. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Inst. Radiofiziki i Ehlektroniki. 1987. (In Russian). In *Physics and technique in millimeter and submillimeter waves.* Order Number DE89012210/JAW. Available from NTIS (US Sales Only), PC A03/MF A01; INIS.

Transition radiation of electron flux passing through the structure metal-semiconductor-metal is investigated. Matrix elements describing the processes of production and destruction of transverse electrons and photons during their interaction with electrons are found. The corresponding kinetic equations are obtained. The possibility of semiconductor eigen vibration instability as a result of induced radiation of nonequilibrium electrons is discussed.

46605 (INIS-SU–94/A, pp. 7-10) **Light Raman spectra of silicon subsurface layers implanted by selenium.** Avakyants, L.P.; Gorelik, V.S.; Obraztsova, E.D.; Khashimov, R.N. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Experimental and theoretical physics.* Order Number DE89012156/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 8.

Light Raman scattering (RS) in silicon crystal subsurface region is investigated; silicon is implanted by selenium ions with 100 keV energy and $1x10^{13}$, $3x10^{13}$, $3x10^{14}$, $1x10^{15}$ cm^{-2} doses. Frequency shifts and phonon line broadening during silicon ion implantation by selenium are detected on the basis of methods of difference RS spectroscopy near the surface. Quantitative characteristics of change in RS intensity depending on the selenium dose implanted to silicon are constructed. The results obtained permit to estimate mechanical stresses in semiconductor near-the-surface lyers subjected to ionic implantation to an accuracy of 10^8 H/m^2. 9 refs.; 3 figs.

Kratkie soobshcheniya po fizike.; v. 1.

A sharp decrease in the constant of $Pb_{0.78}Sn_{0.22}Te$(In) lattice in the range of 0.7-0.8 at. % In is explained by the lattice deformation when the impurity level in In is populated by electrons. The deformation potential is determined, being $E_1 \simeq 15$ eV. 10 refs.

46609 (MLM–3603) **Ion implantation of two titanium alloys.** Barton, B.D.; Wittberg, T.N. EG and G Mound Applied Technologies, Miamisburg, OH (USA). 28 Aug 1989. 27p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. Order Number DE89016958/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Samples of two titanium alloys, Ti-6Al-4V and Ti-15V-3Cr-3Sn-3Al, were ion implanted with a combination of nitrogen (N^+) and oxygen (O^+). For each alloy, implantation parameters were chosen to give implanted nitrogen concentrations of approximately 10 atom % in one case and 50 atom % in another, from a depth of 100 nm to a depth of 400 nm. In all but one case, dual energy (200 keV and 90 keV) implantations of nitrogen were used to give a relatively uniform nitrogen concentration over a region of 300 nm. In each case, oxygen was implanted at 35 keV, following the nitrogen implantation, to give an oxygen-enriched region near the surface. The implanted samples were examined by optical microscopy and by Auger electron spectroscopy (AES). Depth profiles, determined by AES combined with argon ion sputtering, were in good agreement with theoretical predictions. Experimental observations were consistent with the formation of a solid solution of nitrogen in a titanium alloy phase in the case of alloys implanted to a level of 10 atom %; and compound formation was indicated in the case of alloys implanted to a level of 50 atom %. 20 refs.

46610 Quantitative studies of glow-discharge deposition using optical emission spectroscopy. Kampas, F.J. (Div. of Metallurgy and Materials Science, Brookhaven National Lab., Upton, NY (US)). vp. of Plasma synthesis and etching of electronic materials. Chang, R.P.H.; Abeles, B. Materials Research Society, Pittsburgh, PA (1985). (CONF-841157–: Materials Research Society annual meeting, 26-29 Nov 1984).

Intensities of CH optical emission and electrical properties of methane rf discharges as a function of pressure are presented and discussed. The results are consistent with a model in which the properties of the discharge are dominated by secondary electrons traversing the gap between the electrodes.

46611 Ion-enhanced chemical reaction of XeF_2 with silicon by modulated molecular beam mass spectrometry. Balooch, M. (Chemistry and Materials Science Div. of Lawrence Livermore National Lab. (US)); Olander, D.R.; Siekhaus, W.J. vp. of Plasma synthesis and etching of electronic materials. Chang, R.P.H.; Abeles, B. Materials Research Society, Pittsburgh, PA (1985). (CONF-841157–: Materials Research Society annual meeting, 26-29 Nov 1984).

The reaction of XeF_2 with the Si(100) surface was studied by modulated (10-1000 Hz) molecular beam-mass spectrometry in the temperature range 300-1300K and equivalent XeF_2 pressure of $5x10^{-6}$ to 10^{-4} Torr. Simultaneous bombardment of the reacting surface by Ar^+ was used to determine the extent of ion-enhancement of the reaction. In the absence of the ion beam, the main reaction product was SiF_4, whiich was formed with a reacton probability of $-5x10^{-2}$ at room temperature. In the presence of the ion beam three products, SiF_4, SiF_2 and F_2 (or F), were detected with formation probabilities of $-1x10^{-1}$, $6x10^{-2}$ and $7x10^{-2}$ respectively. Increasing surface temperature reduced the ion-enhanced reactivity.

46612 Simulation of spatially dependent excitation rates and power deposition in RF discharges for plasma processing. Kushner, M.J. (Mathematical Science Northwest, 2755 Bellevue Way, Bellevue, WA (US)); Anderson, H.M.; Hargis, P.J. vp. of Plasma synthesis and etching of electronic materials. Chang,

R.P.H.; Abeles, B. Materials Research Society, Pittsburgh, PA (1985). (CONF-841157–: Materials Research Society annual meeting, 26-29 Nov 1984).

In low pressure, radio frequency (RF) discharges of the type used in plasma processing of semiconductor materials, the rate of electron impact excitation and energy transfer processes depends upon both the phase of the RF excitation and position in the discharge. Electron impact collisions create radicals that diffuse or drift to the surfaces of interest where they are adsorbed or otherwise react. To the extent that these radicals have a finite lifetime, their transport time from point of creation to surface of interest is an important parameter. The spatial dependence of the rate of the initial electron impact collisions is therefore also an important parameter. The power that sustains the discharge is coupled into the system by two mechanisms: a high energy e-beam component of the electron distribution resulting from electrons falling through or being accelerated by the sheaths, and by joule heating in the body of the plasma. In this paper, the authors discuss the spatial dependence of excitation rates and the method of power deposition iin RF discharges of the type used for plasma processing.

46613 Plasma deposition of wide gap, highly photoconductive a-Si:H thin films from disilane-helium mixtures. Rajeswaran, G. (Div. of Metallurgy and Materials Science, Brookhaven National Lab., Upton, NY (US)); Vanier, P.E.; Corderman, R.R.; Kampas, F.J. vp. of Plasma synthesis and etching of electronic materials. Chang, R.P.H.; Abeles, B. Materials Research Society, Pittsburgh, PA (1985). (CONF-841157–: Materials Research Society annual meeting, 26-29 Nov 1984).

Wide gap (>1.9 eV), photoconductive, intrinsic amorphous silicon films were made in a UHV system from Si_2H_6-He mixtures. The hydrogen concentrations, optical gaps and photoconductivities were measured. Unlike films made from SiH_4, Si_2H_6-produced films exhibit excellent electronic properties even at low deposition temperatures. The ratio of Am1 photoconductivity to dark conductivity was as high as 10^7.

46614 Plasma deposition of amorphous metal alloys. Hays, A.K. (Sandia National Labs., Div. 1831, Albuquerque, NM (US)). vp. of Plasma synthesis and etching of electronic materials. Chang, R.P.H.; Abeles, B. Materials Research Society, Pittsburgh, PA (1985). (CONF-841157–: Materials Research Society annual meeting, 26-29 Nov 1984).

Rapid solidification, sputtering and electroless chemical deposition have been used to produce amorphous metal alloys which possess excellent corrosion and abrasion resistance. This paper discusses a new technique for obtaining amorphous metal alloy coatings. Plasma decomposition of $Ni(CO)_4$ and PH_3 in argon and hydrogen carrier gases [$Ni(CO_4/PH_3$–8/1] yielded films that were black and silver, respectively, in appearance. Both films were amorphous as determined by transmission electron microscopy. Films deposited using a hydrogen carrier gas were three orders of magnitude more conductive than those deposited using an argon carrier gas. Analysis of both films using electron microprobe analysis and inductively-coupled plasma spectroscopy showed an enrichment of P in the films over the P content in the plasma gas mixtures. Reducing the P content of the plasma gas mixture [$Ni(CO)_4/PH_3$–17/11 yielded crystalline films with no P enrichment. The grain size in these films was –60Δ as determined by x-ray line-broadening.

46615 Near-surface compositional modifications of ternary alloys during sputtering at elevated temperatures. Yacout, A.M. (Argonne National Lab., IL (USA). Materials Science Div.); Lam, N.Q.; Stubbins, J.F. *Nuclear Instruments and Methods in Physics Research, Section B: Beam Interactions with Materials and Atoms (Netherlands),* 42(1): 49-60 (May 1989). DOE Contract W-31-109-ENG-38.

The complex interplay of several physical processes in producing changes in the surface and subsurface compositions of ternary alloys during high-temperature ion bombardment has been theoretically investigated, using a phenomenological model that includes Gibbsian adsorption, preferential sputtering, displacement mixing, radiation-enhanced diffusion, and radiation-induced segregation. Sample calculations were performed for an Fe-Cr-Ni solid solution, representative of an austenitic stainless steel, under 3 keV Ne^+ sputtering. The effects of the diverse phenomena involved were examined in details as a function of time and temperature. The present model calculations provide useful information about ion-beam modifications, which is important in the areas of sputter depth-profiling of multicomponent materials and elevated-temperature ion implantation. (orig.).

46616 MEASTRI: A hybrid analytical/Monte Carlo code for particle transport in solids. Brice, D.K. (Sandia National Labs., Albuquerque, NM (USA)). *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 162-164: 164 (Apr 1989). DOE Contract AC04-76DP00789. (CONF-8805285–: 8. international conference on plasma surface interactions in controlled fusion devices (PSI-8), 2-6 May 1988).

We report on a hybrid analytic/Monte Carlo code for evaluating particle transport in solids. In this code, atomic concentrations in the near surface implanted region of a target material, $N_k(x, t)$, are propagated in time through the method of equivalent atomic stopping (MEAS). The implantation source profiles $P_k(x, t)$, initially obtained from the TRIM code, are propagated along with the $N_k(x, t)$. In addition, TRIM is invoked periodically to provide updated profiles $P_k(x, t)$, since the MEAS procedure includes only first order corrections to the P_k. The code provides for simultaneous implantation of different atomic species and includes the local mixing model (LMM) for describing buildup to saturation and isotope exchange for implantation of hydrogen and/or other species. Since the MEAS procedure is analytic, both sputtering and diffusion are included in a natural way, and disparate time scales, e.g. for implantation, sputtering and diffusion, are easily accommodated. The code is particularly useful for high fluence implantation. Example calculations for simultaneous C and D implantation into graphite are compared with experimental data obtained from TFTR limiter tiles. (orig.).

46617 Numerical study of the two-dimensional Hubbard model. White, S. R. (Department of Physics, University of California, Santa Barbara, Santa Barbara, California 93106(US)); Scalapino, D. J.; Sugar, R. L.; Loh, E. Y.; Gubernatis, J. E.; Scalettar, R. T. *Physical Review [Section] B: Condensed Matter (USA),* 40(1): 506-516 (1 Jul 1989). DOE Contract FG03-85ER45197.

We report on a numerical study of the two-dimensional Hubbard model anddescribe two new algorithms for the simulation of many-electron systems. Thesealgorithms allow one to carry out simulations within the grand canonicalensemble at significantly lower temperatures than had previously been obtainedand to calculate ground-state properties with fixed numbers of electrons. Wepresent results for the two-dimensional Hubbard model with half-andquarter-filled bands. Our results support the existence of long-rangeantiferromagnetic order in the ground state at half-filling and its absence atquarter-filling. Results for the magnetic susceptibility and the momentumoccupation along with an upper bound to the spin-wave spectrum are given. Wefind evidence for an attractive effective *d*-wave pairing interaction nearhalf-filling but have not found evidence for a phase transition to asuperconducting state.

46618 Structure of rubidium uranyl(VI) trinitrate. Zalkin, A. (Lawrence Berkeley Lab., CA (USA). Materials and Chemical Sciences Div.); Templeton, L.K.; Templeton, D.H. *Acta Crystallographica, Section C: Crystal Structure Communications (Denmark),* 45(5): 810-811 (15 May 1989). DOE Contract AC03-76SF00098.

$RbUO_2(NO_3)_3$, M_r=541.51, hexagonal, Ranti 3c, a=9.384(4), c=18.899(6) A, V=1441.3(14) A^3, Z=6, D_m=3.72, D_x=3.743(4) g cm^{-3}, Mo Kα, λ(α_1)=0.70930 A, μ=209.7 cm^{-1}, F(000)=1428, T=296 K, R=0.014 for 261 independent reflections with $I>2\sigma(I)$. The uranyl ion is coordinated in bidentate fashion by three nitrate ions in its equatorial plane. Bond lengths are U-O=1.746(4) (uranyl), 2.474(3) (nitrate), N-O=1.205(6) (terminal), 1.268(4) A (bridge). The anomalous-scattering term f' for U measured at 0.71 A is -10.7(2). (orig.).

46619 Multiple-scattering Green-function method for space-filling cell potentials. Gonis, A. (Division of Chemistry and Materials Science (L-280), Lawrence Livermore National Laboratory, Livermore, California 94551(US)); Zhang, X.; Nicholson, D. M. *Physical Review [Section] B: Condensed Matter (USA),* 40(2): 947-965 (15 Jul 1989). DOE Contract W-7405-ENG-48.

It is shown that the equations of multiple-scattering theory (MST)originally derived for scattering off collections of muffin-tin (MT)potentials, i.e., potential cells bounded by nonoverlapping spheres, remainvalid in the case of arbitrarily shaped, nonoverlapping, and particularlyspace-filling potential cells. Specifically, it is shown that in the angularmomentum representation the total scattering (transition) matrix, the Greenfunction, the Bloch function for a translationally invariant material, and theLloyd formula for the change in the integrated density of states have formsthat are invariant with respect to the partition of a given potential intononoverlapping cells, and with respect to the choice of the cell centers. Ananalytic proof is provided for the vanishing of near-field corrections (NFC's)long conjectured to arise when the spheres bounding individual cells overlapone another or adjacent potentials. Thus, the well-known MST expressions,originally derived for the case of MT potentials, for obtaining the solution ofthe Schrödinger equation and hence determining the band structure and thecharge density of materials, ordered or disordered, are rigorously valid in thecompletely general case of arbitrarily shaped cells. The differences betweenthis work and previous attempts to generalize MST to non-MT space-fillingpotentials are discussed. It is pointed out that in calculations involvingnon-MT potential cells, particular attention must be paid to the question ofconvergence of expansions in angular momentum eigenstates. This convergence istested numerically in terms of cluster calculations and through the calculationof the electronic structure of elemental bcc Nb and fcc Zr and Rh.

46620 (DOE/ER/45268–T1) **Studies of novel superconductors: Progress report, January 1, 1989–December 31, 1989.** Stewart, G.R. Florida Univ., Gainesville, FL (USA). Dept. of Physics. Aug 1989. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER45268. Order Number DE89016744/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Important progress has been made in understanding the formation of the heavy fermion ground state via specific heat, susceptibility, and resistivity studies of $U_{1-x}M_xBe_{13}$, $0 \leq x \leq .995$ and M = Hf, Zr, Sc, Y, La, Ce, Pr, Lu and Th. The high effective mass, m*, in UBe_{13} was found to be caused both by single-ion effects, which contribute about 50% of the large specific heat $\gamma(\alpha\ m^*)$, and also by a many body correlation which depends on complete occupation of the U sites by U, i.e., the Kondo-lattice model. This is the first such demonstration of how the large m* ground state is formed in a heavy fermion compound. In the single-ion regime, we have found that it is the U-Be separation that is the controlling factor, not the effective U-U distance (α dilution) nor the identity of the doping metal M. Progress has also been made on other heavy fermion research projects, including the response of T_c in UPt_3 to "nonmagnetic" impurities, the T_c of "super-pure" UBe_{13}, and the behavior of C in high field of $CeCu_6$. Additionally, a new heavy fermion compound, $NpPt_4Au$, has been discovered, improving our understanding of the temperature dependence of the formation of m* at low temperatures. 5 figs.

46621 (IC–89/21) **Model of the isotope effect of the oxide superconductor.** Zhang Liyuan. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 7p. Order Number DE89635907/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

In this paper, a possible mechanism of producing negative correlation energy centers is proposed. Combining this electronic attractive potential with phonon mediated attractive potential between carriers the isotope effect exponent of La-Sr-Cu-O system is quantitatively explained. Generally, the isotope effect exponent is smaller than 1/2 in this mechanism. (author). 20 refs, 1 fig.

46622 (IC–89/39) **On the free carrier-negative U center interacting model for the high-T_c oxide superconductor.** Zhang Liyuan. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 8p. Order Number DE89635908/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Using the free carrier-negative U center interacting model, we have investigated the superconducting transition temperature (T_c), the specific heat jump at T_c, the coherence length, the penetration depth, the thermodynamic critical field and the isotope effect for the high-T_c oxide superconductor. The theoretical values of these physical quantities are consistent with the experimental values. Further, the residual electronic specific heat in the superconducting state is explained as the result of the inherent instability in this superconductive mechanism. (author). 26 refs.

46623 (IC–89/45) **Modified Ginzburg-Landau theory for anisotropic high temperature superconductors.** Shehata, L.N. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 23p. Order Number DE89635909/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The modified Ginzburg-Landau theory, MGL, for strongly anisotropic high temperature superconductors (HTSC's) is reviewed and the MGL equations are re-derived to be used in solving two important fundamental problems. The first one concerns the evaluation of the domain-wall energy problem by a complete solution of the derived equations. The modified free energy functional is used to calculate the maximum supercurrents in both HTSC's and the conventional superconductors. Our calculations show that the surface energy vanishes at the critical value of the GL parameter $\kappa_c = 1/\sqrt{2}\{(1-M)(1+M/3)\}^{1/2}$, where $0 \leq M < 1$. Therefore, the transformation from type II to type I superconductivity is possible at temperatures very close to the transition critical one, at which $\kappa(T)$ becomes zero. The generalized formulas of the superconducting current allowed us to calculate the maximum supercurrents for both the HTSC's and the conventional ones. The possible maximum currents are anisotropic and have higher values for HTSC's. Our results are in good agreement with the related theoretical works as well as with the experimental data. (author). 25 refs, 3 figs.

A microscopical model for description of acoustic properties at structural phase transition in $La_{2-x}Sr_xCuO_4$ superconductors is proposed. Experimentally observed acoustic anomalies are described in the framework of the model. 3 refs.; 1 fig.

46626 (JINR-N–4(30)-88, pp. 78-82) **Magnetization of $YBa_2Cu_3O_{7-x}$ ceramics after irradiation with carbon relativistic nuclei.** Gocharov, I.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy); Omel'yanovskij, O.E. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. (In Russian). In *JINR rapid communications. Collection of papers.* Order Number DE89012196/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

R(T), chi(T) and M(B) of samples of $YBa_2Cu_3O_{7-x}$ ceramics were measured after irradiation with relativistic nuclei of fluorine and carbon (maximum fluence of $6{,}3x10^{12}$nucl./cm^2). The curves of R(T) and chi(T) for irradiated samples do not differ from those for an initial sample. At the same time the difference between M_- and M_+ and, consequently, the value of intragrain current density j_c pass via maximum located at the fluences less than $2x10^{12}$nucl./cm^2 (for the case when magnetic field is parallel to tracks). 11 refs.; 2 figs.

46627 (JINR-N–4(30)-88, pp. 83-86) **Stabilization of high-temperature superconductor $Y_1Ba_2Cu_3O_{7-\delta}$ surface.** Korenev, S.A.; Valentovic, D.; Lushchikov, V.I. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012196/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

A technique is suggested for stabilization of a high-temperature superconductor $Y_1Ba_2Cu_3O_{7-\delta}$ surface by means of a high-current pulsed electron beam (J=12,5-65 A/cm^2, E=70-200 keV, t=300 ns, P=0,001 Pa). The quality of the remelted surface film is characterized and first experimental results are discussed. It is shown that within 50 days after the electron beam processing, no dielectric film was developed at superconductor surface and superconductor characteristics did not change. 6 refs.; 4 figs.

46628 (JINR-N–4(30)-88, pp. 95-106) **Temperature dependence of critical current and I-V characteristics in the $YBa_2Cu_3O_7$(y) and $Bi_2S_2CaCu_2O_8$(Bi) ceramics.** Drobin, V.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy); Dyachkov, E.I.; Trofimov, V.N. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012196/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

The temperature dependence of the transport critical current I_{cr} and the I-V characteristics (IVC) for Y and Bi ceramic samples has been measured. For 0,05 ->T/T_{cr}<1 , it was found that $I_{cr}\sim(T=c_r-T)^{\alpha}$ for both the types of high-T_c superconductors, with α=1,24 and 1,48 (two samples) for Y and α=2,58 for Bi. For the low voltage region of the IVC (V->I mV), voltage and current could be naturally normalized so that for the nondimensional quantites $U=i^{\gamma(T)}$ both for Bi and Y. At the same time a great dicrepancy in the temperature dependence of the characteristic parameters of the IVC fit point to a quite different process of transport current dissipation in Y and Bi. 10 refs.; 4 figs.

46629 (LA-UR–89-2564) **On the photoemission spectrum and optical gap in La_2CuO_4.** Martin, R.L. Los Alamos National Lab., NM (USA). 1989. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890953–1: International conference on the physics of highly correlated electron systems, 11-15 Sep 1989). Order Number DE89015281/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The photoemission and optical spectrum of La_2CuO_4 are computed for a CuO_6 cluster model using the techniques of ab initio quantum chemistry. Evidence for a near degeneracy and strong electronic coupling between the configurations $Cu^{3+}O^{2-}$ (^{1}Ag) and $Cu^{2+}O^{1-}$ (^{1}Ag) is presented. This interaction leads to d^9 character at the Fermi energy as well as in the 12eV satellite. 17 refs., 1 fig., 2 tabs.

46630 (UCRL–101545) **Adaptation of the theory of superconductivity to the behavior of oxides.** Teller, E. Lawrence Livermore National Lab., CA (USA). Jul 1989. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8905143–11: NATO international advanced course on the nuclear equation of state, 12 May - 3 jun 1989). Order Number DE89016518/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An adaptation of the conventional theory to high-temperature superconductors is proposed. Excitation of electrons from below the Fermi surface to above the Fermi surface (according to Bardeen, Copper and Schrieffer) is replaced by excitation from a filled energy band into an empty one. The energy bands are constructed from two-dimensional Bloch functions in neighboring layers of the oxide lattices. Strong coupling with lattice displacements is due to the removal of the topmost electrons from the O^{2-} ions in the perovskite planes. The main methods of the BCS theory are retained. The formation and observability of a super-lattice is discussed.

46631 Order of phase transition in high temperature superconductivity. Lee, T.D. (Columbia Univ., New York, NY (USA)). *Modern Physics Letters B (USA),* 3(2): 135-139 (Feb 1989).

The authors present arguments that the phase transition in some of the newly discovered high temperature superconductors is first-order, unlike the usual Λ-transition.

46632 (AD-A–207798/0/XAB) **Problem of selecting the shape functions for a p-type finite element. Final report.** Babuska, I.; Griebel, M.; Pitkaranta, J. Maryland Univ., College Park, MD (USA). Inst. for Physical Science and Technology. Nov 1988. 40p. (BN–1090). Available from NTIS, PC A03/MF A01.

Also available as Rept. nos. MD88-36-IB-MG-JP and TR88-36.

This paper addresses the question of the optimal selection of the shape functions for p-type finite elements and discusses the effectivity of the conjugate-gradient and multilevel-iteration method for solving the corresponding linear system. The selection of the shape functions is of major importance for the performance of the solver based on iterative methods. Neither the theory nor practice of the optimal selection of the shape functions is available yet. We have seen that the condensation approach which has obvious advantages from the point of parallel computations is a very effective tool for keeping the condition number under the control and is especially advantageous for the conjugate gradient method.

46633 (AD-A–208103/2/XAB) **Quantization by cosmic-background radiation. Technical report.** Dehn, J.T. Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab. May 1989. 27p. (BRL-TR–2991). Available from NTIS, PC A03/MF A01.

This paper suggests that various modes in the cosmic-background radiation field may account for the discrete properties exhibited by small systems. In particular, this view is applied to the one-, two-, and three- dimensional oscillators and the hydrogen atom, systems which were treated by Schroedinger in his first papers on quantum mechanics. The usual energy formulas for the above systems are derived using this point of view, together with some indication of how transition probabilities might also be calculated. A connection between de Broglie's associated wave and a free mass moving in the cosmic background is also discussed. Analogs of the uncertainty and correspondence principles are briefly mentioned as are some of the implications this view might have for interpreting quantum theory. In this view particles and waves are separate, interacting entities and not complementary aspects of the same thing.

46634 (ANL/MCS-TM–133) **The bidiagonal singular value decomposition and Hamiltonian mechanics: LAPACK working note No. 11.** Deift, P.; Demmel, J.; Li, Luen-Chau; Tomei, C. Argonne National Lab., IL (USA). Mathematics and Computer Science Div. Aug 1989. 66p. Sponsored by ANL;DOE/ER;NSF. DOE Contract W-31109-ENG-38. DMS-8802305;DCR-8552474;ASC-8715728;DMS-8704097. Order Number DE89016545/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

We consider computing the singular value decomposition of a bidiagonal matrix B. This problem arises in the singular value decomposition of a general matrix, and in the eigenproblem for a symmetric positive definite tridiagonal matrix. We show that if the entries of B are known with high relative accuracy, the singular values and singular vectors of B will be determined to much higher accuracy than the standard perturbation theory suggests. We also show that the algorithm computes the singular vectors as well as the singular values to this accuracy. We also give a Hamiltonian interpretation of the algorithm and use differential equation methods to prove many of the basic facts. The Hamiltonian approach suggests a way to use flows to predict the accumulation of error in other eigenvalue algorithms as well. 36 refs., 2 figs., 2 tabs.

46635 Diffraction contrast of a Bragg-Fresnel lens in white and monochromatic radiation. Aristov, V.V. (Institute of Problems of Microelectronics Technology and High Purity Materials, Chernogolovka (USSR)); Basov, Yu.A.; Frahm, R.; Graeff, W.; Materlik, G.; Snigirev, A.A. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

Recent advances in the studies of x-ray diffraction phenomena and the technology of structures with elements up to hundreds of angstroms in size open up possibilities for fabrication of effective

x-ray focusing elements with three-dimensional Fresnel zone structures, namely, Bragg-Fresnel lenses (BFL). BFL differs favorably from the Fresnel zone plate by the absence of chromatic aberrations which is due to the high spectral selectivity of Bragg reflection, $\Delta\lambda/\lambda \sim 10^{-4} \div 10^{-5}$. This enables observation of focusing and image transmission in the white spectrum of synchrotron radiation (SR). 7 refs., 7 figs.

International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 15p. Order Number DE89635702/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A gauge-invariant theory of a massive spin-3/2 particle interaction with external electromagnetic and gravitational fields, obtained earlier by Kaluza-Klein reduction of a massless Rarita-Schwinger theory, is quantized using Dirac's procedure. The field anticommutators are found to be positive definite. The theory, which was earlier shown to be free from the classical Velo-Zwanziger problem of noncausal propagation modes, is thus also free from the problem of negative-norm states, a long-standing problem associated with massive spin-3/2 theories with external interaction. (author). 19 refs.

46639 (IC–89/40) **Langevin formulation of quantum dynamics.** Roncadelli, M. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 11p. (CERN-TH–5360/89). Order Number DE89635703/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

We first show that nonrelativistic quantum mechanics formulated at imaginary-(h/2 π) can formally be viewed as the Fokker-Planck description of a frictionless brownian motion, which occurs (in general) in an absorbing medium. We next offer a new formulation of quantum mechanics, which is basically the Langevin treatment of this brownian motion. Explicitly, we derive a noise-average representation for the transition probability W(X",t"—X',t'), in terms of the solutions to a Langevin equation with a Gaussian white-noise. Upon analytic continuation back to real-(h/2 π),W(X",t"—X',t') becomes the propagator of the original Schroedinger equation. Our approach allows for a straightforward application to quantum dynamical problems of the mathematical techniques of classical stochastic processes. Moreover, computer simulations of quantum mechanical systems can be carried out by using numerical programs based on the Langevin dynamics. (author). 19 refs, 1 tab.

International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 24p. Order Number DE89635704/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

An exactly soluble problem for the finite-difference Schroedinger equation in the relativistic configurational space is considered. The appropriate finite-difference generalization of the factorization method is developed. The theory of new special functions "the relativistic Hermite polynomials", in which the solutions are expressed, is constructed. (author). 14 refs.

46641 (IC–89/46) **Blow-up and global existence for heat flows of harmonic maps.** Chen Yunmei; Ding Weiyue. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 16p. Order Number DE89635694/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

In this paper it is proved that the solution to the evolution problem for harmonic maps blows up in finite time, if the initial map belongs to some nontrivial homotopy class and the initial energy is sufficiently small. However, the solution exists globally in time and subconverges to a constant map, if the initial energy density is bounded by a constant and the initial energy is sufficiently small, depending on this constant. (author). 20 refs.

46642 (IC–89/48) **Supergrassmannians, super tau-functions and strings.** Dolgikh, S.N.; Schwarz, A.S. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 17p. Order Number DE89635695/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Recently, infinite-dimensional grassmannians and their supergeneralizations were used to study conformal two-dimensional fields and strings. In particular, the super Mumford form (holomorphic square root from the superstring measure on moduli space) was expressed through super analog of Sato tau-function. In this paper we present results of supergrassmannians and super tau-functions. 8 refs.

46643 (IC–89/53) **Continuity of conditional expectations.** Brambila-Paz, F.; Alonso, A. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 7p. Order Number DE89635696/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

A condition over a sequence A_n of σ-subalgebras that assures L^p-convergence of the conditional expectations will be given. This condition is more general than the Martingale theorem condition and the O'Reilly-Fetter condition. (author). 3 refs.

46644 (IC–89/54) **On the automorphisms of foliations defined by complex linear vectorfields.** Shahshahani, S. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 14p. Order Number DE89635697/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

We study biholomorphisms of C^n that preserve the foliation associated to a complex linear vector fields. It is shown that for hyperbolic Poincare vector fields the only such biholomorphisms are linear. Nonlinear biholomorphisms emerge in the presence of resonance among the eigenvalues of the system. A complete classification is given in dimension 2. (author). 8 refs, 1 fig.

46645 (IC–89/55) **Continuum analogues of contragredient Lie algebras. Lie algebras with a Cartan operator and nonlinear dynamical systems.** Saveliev, M.V.; Vershik, A.M. International Centre for Theoretical Physics, Trieste (Italy). Mar 1989. 14p. Order Number DE89635698/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

We present an axiomatic formulation of a new class of infinite-dimensional Lie algebras - the generalizations of Z-graded Lie algebras with, generally speaking, an infinite-dimensional Cartan subalgebra and a contiguous set of roots. We call such algebras "continuum Lie algebras". The simple Lie algebras of constant growth are encapsulated in our formulation. We pay particular attention to the case when the local algebra is parametrized by a commutative algebra while the Cartan operator (the generalization of the Cartan matrix) is a linear operator. Special examples of these algebras are the Kac-Moody algebras, algebras of Poisson brackets, algebras of vector fields on a manifold, current algebras, and algebras with differential or integro-differential Cartan operator. The nonlinear dynamical systems associated with the continuum contragredient Lie algebras are also considered. (author). 9 refs.

46646 (IC–89/67) **Flow of harmonic applications of a compact variety on a bordered variety.** Chen Yunmei; Musina, R. International Centre for Theoretical Physics, Trieste (Italy). May 1989. 5p. (In French). Order Number DE89635699/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

If M is a compact riemannian variety and C a riemannian variety closed to border, a weak harmonic application μ:M->C is defined as being a solution of a differential inclusion. We present a theorem of existence and partial regularity for the weak solution of the evolution inclusion for harmonic applications. This solution converges to a weak harmonic application when the time tends appropriately to infinity. 10 refs.

46647 (IC–89/72) **Chern-Simons theories of symplectic super-diffeomorphisms.** Sezgin, E.; Sokatchev, E. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 12p. Order Number DE89635700/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

We discuss the symplectic diffeomorphisms of a class of supermanifolds and the structure of the underlying infinite dimensional superalgebras. We construct a Chern-Simons (CS) gauge theory in 2+1 dimensions for these algebras. There exists a finite dimensional supersymmetric truncation which is the (2^n-1)-dimensional Hamiltonian superalgebra H-tilde(n). With a central charge added, it is a superalgebra, C(n), associated with a Clifford algebra. We find an embedding of d=3, N=2 anti-de Sitter superalgebra OSp(2—2)+OSp(2—2) in C(4), and construct a CS action for its infinite dimensional extension. We also discuss the construction of a CS action for the infinite dimensional extension of the d=3, N=2 superconformal algebra OSp(2,4). (author). 18 refs.

46648 (IC–89/73) **Lefschetz trace formula and BRST.** Schwarz, A. International Centre for Theoretical Physics, Trieste (Italy). Apr 1989. 7p. Order Number DE89635705/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Quantum systems with constraints showing how the BRST-transformation and the BFV-method of quantization can be understood directly in this case are studied in this paper. The results concerning the quantization of classical constrained systems can be derived from the results for quantum systems. 7 refs.

46649 (IC–89/84) **Modular invariants for theta-functions with characteristics and the twisted N=2 superconformal and SU(2) Kac-Moody algebras.** Dobrev, V.K.; Ganchev, A.H. International Centre for Theoretical Physics, Trieste (Italy). May 1989. 16p. Order Number DE89635701/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

We classify the modular invariants for θ-functions with characteristics relevant for the twisted N=2 super-Virasoro and the twisted SU(2) Kac-Moody algebras. Detailed and complete proofs are given. Based on this we give the classification of the modular invariants for the above algebras. (author). 26 refs.

46650 (INIS-BR–1571) **Microscopy of bosonic models using Schwinger and Holstein - Primakoff bosonization techniques.** Pinto, M.E.B. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. 1988. 53p. (In Portuguese). Order Number DE89635706/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

Two kinds of bosonic expansions for the SU(2) case, one being finite (Schwinger) and the other being infinite (Holstein-Primakoff) are analysed. The existence of a transformation connecting them was discussed. Utilizing the two methods, the Two Level Model hamiltonian into the many boson space is mapped. Considering systems composed by 4, 6 and 14 particles, calculations for the eigenenergies within the "vibrational limit" of the model were performed. The results show that the Schwinger mapping is exact. Approximated bosonic images with the Holstein-Primakoff mapping are obtained. Indeed, the anharmonicities observed in the region between the ideal " spherical limit" and the "transitional point", were well described by the approximation containing up to quartic terms on the bosonic operators. (author).

46651 (INIS-SU–94/A, pp. 25-27) **On some properties of energy levels in complex region.** Ushveridze, A.G. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). Kratkie soobshcheniya po fizike.; no. 8.

Applicability of the electrostatic analog problem and the nonstandard theory of perturbations for investigation of spectral Riemann varieties in models of quantum mechanics is discussed. 5 refs.

46652 (LA-UR–89-2656) **Magnetic flux compression.** Fowler, C.M. Los Alamos National Lab., NM (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890812–30: American Physical Society topical conference on shock compression of condensed matter, 14-17 Aug 1989). Order Number DE89016991/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Magnetic Flux Compression, as treated in this paper, is accomplished by high explosives. Flux is first captured in a closed conducting circuit, of which some or all of the conducting elements are overlaid with high explosives. Upon detonation of the explosives, these elements are driven in such a fashion as to compress the flux into regions of smaller areas or, in engineering terminology, into regions of lower inductance. The magnetic energy associated with the flux is increased by the flux compression. The additional energy is ultimately supplied by the explosive as it drives the conductors against the magnetic field pressure, which in some cases may be in the megabar range. Various names in common use for flux compression devices are flux compression generators (FCG), magneto-cumulative generators (MCG), particularly in the USSR, or simply, flux compressors. FCGs are generally used in two broadly defined categories: as compact, high-power sources to drive various loads: and as generators of very large magnetic fields. In this talk, general principles of flux compression are first discussed. This is followed by a description of several applications in which different types of FCGs are used to supply pulsed power to various devices. The talk closes with a discussion of results obtained from a number of experiments done to explore the properties of materials in very large magnetic fields or under nearly isentropic compression. As requested, the work reported here surveys the Los Alamos program. However, sources cited in the bibliography contain much of the extensive literature in the field. Individual papers cited have been selected partly to highlight other groups that have been active in the field. 25 refs., 15 figs.

46653 (LNCC–018/88) **On scattering by time-dependent potentials: the 2-D case.** Ferreira, J.A.; Menzala, G.P. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). May 1988. 29p. Order Number DE89635708/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A real potential q(x,t) which has compact support in space x epsilon IR^2 and it is "damped" is considered. The solutions of U sub (tt) $-\Delta u + q(x,t)u = 0$ showing that under additional technical assumptions on q the scattering operator exists are studied. The proofs are elementary. (author).

46654 (LNCC–019/88) **On the superconvergence of the SBB method.** Franca, L.P. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). May 1988. 29p. Order Number DE89635709/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Written in a mixed form a simple two-point boundary value problem is shown to have superconvergence characteristics under the SBB method. Convergence and accuracy analyses reveal superior performance of the method compared to the usual Galerkin method. (author).

46655 (LNCC–021/88) **Recent applications of classical mechanics to pure and applied mathematics.** Koiller, J. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). Jun 1988. 23p. (In Portuguese). Order Number DE89635710/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A mixed bag of results and recent articles in Symplectic Geometry and Hamiltonian Mechanics, emphasizing the interaction with several areas of Pure and Applied Mathematics, is presented. (author).

46656 (LNCC–022/88) **Algorithm to compute the square root of 3x3 positive definite matrix.** Franca, L.P. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). Jun 1988. 26p. Order Number DE89635711/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

An efficient closed form to compute the square root of a 3 x 3 positive definite matrix is presented. The derivation employs the Cayley-Hamilton theorem avoiding calculation of eigenvectors. We show that evaluation of one eigenvalue of the square root matrix is

needed and can not be circumvented. The algorithm is robust and efficient. (author).

46657 (LNCC–033/88) **Uniform stability for time-varying infinite-dimensional discrete linear systems.** Kubrusly, C.S. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). Sep 1988. 31p. Order Number DE89635712/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Stability for time-varying discrete linear systems in a Banach space is investigated. On the one hand, it established a fairly complete collection of necessary and sufficient conditions for uniform asymptotic equistability for input-free systems. This includes uniform and strong power equistability, and uniform and strong ^{l}p - equistability, among other technical conditions which also play essential role in stability theory. On other hand, it is shown that uniform asymptotic equistability for input-free systems is equivalent to each of the following concepts of uniform stability for forced systems: ^{l}p -input ^{l}p -state, c_o-input c_o-state, bounded-input bounded-state, $^{l}p>1$ -input bounded-state, c sub (o)-input bounded-state, and convergent-input bounded-state; which are also equivalent to their nonuniform counterparts. For time-varying convergent systems, the above is also equivalent to convergent-input convergent-state stability. The proofs presented here are all "elementary" in the sense that they are based essentially only on the Banach-Steinhaus theorem. (autor).

46658 (LNCC–036/88) **Asymptotic behaviour of solutions of a degenerate quasilinear hyperbolic equation.** Pereira, D.C. Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro, RJ (Brazil). Oct 1988. 12p. Order Number DE89635713/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The decay as $t->\infty$ of the solutions of equation $u''(t)-A^{1/2}u(t)-^{2}Au(t)+Au'(t)=0$ where A is a self-adjoint operator in a Hilbert space H with norm —.— is studied. A decay of algebraic rate for the energy associated to the studied equation is obtained. (author).

46659 (NBI-HE–89-25) **The appearance of matter fields from quantum fluctuations of 2D-gravity.** Kazakov, V.A. Niels Bohr Inst., Copenhagen (Denmark). May 1989. 15p. Order Number DE89915282/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

It is established that various critical regimes may occur for a model of two-dimensional pure quantum gravity. These regimes correspond to the presence of effective fields with scaling dimensions $\Delta_k=-\gamma_{str}.k/2$, k=1, 2, 3 ..., where $\gamma_{str}=-1/m$, m=2, 3, 4 ... is the critical exponent of 'string susceptibility' (with respect to the cosmological constant). This behaviour is typical for unitary conformal fields with the central charge $c=1-6/[m(m+1)]$ in the presence of 2D-quantum gravity. We use the framework of loop equations for the invariant boundary functional, which are exactly solvable in this case. (orig.).

46660 (SAND–89-7101C) **Electromagnetic scattering from multiple cylinders using the bymoment method.** Lee, R.; Cangellaris, A.C. Arizona Univ., Tucson, AZ (USA). Electromagnetics Lab. 14 Jul 1989. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8901135–1: Institute of the Union of Radio Science scientist and engineers student contest, 3-7 Jan 1989). Order Number DE89015888/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We apply the bymoment method to the problem of electromagnetic scattering from multiple cylinders. The bymoment method uses Green's theorem to couple the finite-element solution inside and around each of the cylinders to the exterior region. This method allows us to enclose each cylinder by its own individual mesh, resulting in an enormous computational and memory savings. Numerical results for several cases are presented and compared to series solutions available in the literature. 9 refs., 10 figs.

46661 (UCRL–101506) **Computations of the refraction of a plane shock wave at a slow-fast gas interface.** Puckett, E.G.; Colella, P.; Henderson, L.F. Lawrence Livermore National Lab., CA (USA). 14 Jul 1989. 6p. Sponsored by DOD;DOE/ER. DOE Contract W-7405-ENG-48. IACRO-88-873. (CONF-890756–1: 17. international symposium on shock waves and shock tubes (STS-17), 17-21 Jul 1989). Order Number DE89016508/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We present an example of our computations on a shock wave refracting from CO_2 into CH_4. The results are compared with the experiments of Abdel-Fattah and Henderson. Our input data were the same as the parameters they measured and we used the same boundaries. We also took into account the mutual gas contamination present in the experiments and the effects of a separating membrane. All the principal properties of a free-precursor refraction were detected. 6 refs., 4 figs., 1 tab.

70 FUSION ENERGY

46662 (EGG-M–89203) **An investigation of energy balances in palladium cathode electrolysis experiments.** Longhurst, G.R.; Dolan, T.J.; Henriksen, G.L. EG and G Idaho, Inc., Idaho Falls, ID (USA). 19 May 1989. 30p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8905126–4: Workshop on cold fusion phenomena, 23-25 May 1989). Order Number DE89016268/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In recently publicized cold fusion experiments at the University of Utah, generation of excess heat was reported. To investigate mechanisms that may contribute to energy flows in electrolysis cells, a series of experiments was performed at the Idaho National Engineering Laboratory (INEL). Ordinary water (H_2O), heavy water (D_2O), and mixture of the two were used in the INEL experiments. Cathodes used include a 51-μm Pd foil and 1-mm diameter extruded wire Pd rods in two configurations. Energy balances in these experiments revealed that some of the required voltage to sustain a given current is due to irreversibilities associated with cell operation. Particularly significant are electrolyte resistance and activation energy polarization effects. Energy balances in the INEL experiments showed there was no significant net grain or net loss of energy. Cell overpotential curves were fit well with a Tafel equation, with parameters dependent on electrode configuration, electrolyte composition, and temperature. Water evaporation and interactions of hydrogen isotopes with the Pd cathode were evaluated and found not to be significant to energy balances. No ionizing radiation, tritium production, or other evidence of fusion reactions was seen in the INEL experiments. 4 refs., 6 figs., 2 tabs.

46663 (AD-A–207952/3/XAB) **Plasma theory and simulation. Quarterly progress report Nos. 1-2, 1 January-30 June 1988.** Birdsall, C.K. California Univ., Berkeley, CA (USA). Electronics Research Lab. 30 Jun 1988. 38p. Available from NTIS, PC A03/MF A01.

Sponsored in part by Contract DE-AC03-87ER53254.

A magnetized plasma next to an absorbing wall is simulated, showing positive wall charging causing a large E-field near the wall, than a large ExB drift, then a Kelvin-Helmholtz instability, vortices, and coalescence. Particle transport to the walls is Bohm-like, for omega sub pi > omega sub ci. Plasma transport across B_o to a wall is studied without and with an active antenna buried in the wall. Particle losses are increased appreciably by the fields of the antenna. Small-angle Coulomb collisions produce a drag force and diffusion tensor, which are calculated self-consistently. This produces a FP-PIC method. An example is shown for a beam scattering off fixed ions. Implicit particle simulations are discussed for bounded plasma. The effect of source distribution on the sheath potential is discussed. Initiation of an effort to simulate a traveling-wave tube is discussed. Substantial progress was made in making the authors standard periodic code ES1 work efficiently on a fast PC. A plasma sheath reference listing is discussed.

46664 (AD-A–207975/4/XAB) **Effects of magnetic and collisional viscosity on the E x B gradient drift instability. Memorandum report.** Zalesak, S.T.; Huba, J.D.; Satyanarayana, P. Naval Research Lab., Washington, DC (USA). 27 Apr 1989. 43p. (NRL-MR–6438). Available from NTIS, PC A03/MF A01.

The role of magnetic viscosity (i.e., Larmor radius effects) and collisional viscosity on the ExB gradient drift instability is investigated in both the collisional and inertial regimes. The equations describing the time evolution of small perturbations to an equilibrium two dimensional (x,y) magnetized plasma are derived where the equilibrium electron density is an arbitrary function of y. The equations are then solved iteratively in time to obtain the growth rate of the fastest-growing eigenmode for a given Fourier wavenumber k in the x direction. Results are compared for appropriate profiles with two asymptotic results: the long-wavelength limit, valid for kL less than 1, and the short-wavelength or local limit, valid for kL greater than 1, where L is the gradient scale length of the equilibrium profile. It is found that although the long- and short-wavelength limits do indeed provide accurate growth rates for kL less than 1 and kL greater than 1, respectively, neither provides reliable growth rates for kL approx. 1. In comparing these results to the long-wavelength limit, in addition to affecting gamma in an absolute sense, increasing L to a finite value decreases k sub max, the value of k for which gamma(k) maximizes, and also affects the sharpness of the peak of gamma(k) about k sub max. Both of these phenomena have large effects on freezing models.

46665 (CONF-890931–1) **Hybrid particle-fluid approach to low-frequency turbulence in magnetically confined plasmas.** Leboeuf, J.N.; Fowler, R.H.; Han, J.H.; Lyster, P.M. Oak Ridge National Lab., TN (USA). [1989]. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. conference on the numerical simulation of plasmas; 17-20 Sep 1989. Order Number DE89015904/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have developed a hybrid particle-fluid computer model for quasineutral microinstabilities in magnetically confined plasmas. The ions are treated in the fluid approximation. The electrons are taken as guiding-center macroparticles. The model has been extensively tested for frequency and fluctuation spectra. Linear and nonlinear studies of drift waves, η_i modes, interchange modes, and trapped electron modes have also been carried out. 4 refs., 3 figs.

46666 (CONF-890931–2) **Three-dimensional equilibria and Mercier stability calculations.** Lynch, V.E.; Dominguez, N.; Carreras, B.A.; Varias, A.; Alejaldre, C.; Fraguas, A.L. Oak Ridge National Lab., TN (USA). 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 13. conference on the numerical simulation of plasmas; 17-20 Sep 1989. Order Number DE89015907/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

It is well known that an equilibrium to be used for stability calculations must be extremely accurate. These high accuracy requirements, in a fixed boundary calculation, are translated into high accuracy in the representation of the boundary. These requirements are even stricter for stellarator configurations, for which all the information about the magnetic configuration is given externally through the boundary. Many Fourier components are required to accurately represent the boundary input from a realistic coil system. For torsatron-type configurations, as many as 50 components can be needed to describe the last closed magnetic surface for the vacuum field. For a heliac configuration, the number of components can go up to 200. For 3-D calculations, there is another question of accuracy that does not apply to stability calculations for axisymmetric systems. This is the role of resonant components in the calculation of the geodesic curvature or the Pfirsch-Schlueter current. As Boozer argues, local flattening of the pressure profile eliminates the singularities generated by the resonant components. However, to implement it in a numerical calculation and to eliminate the resonant components, it is necessary to work in a coordinate system with straight magnetic field lines. This creates another problem, since the equilibrium representation in a straight magnetic field lines coordinate system requires many more components than the optimal equilibrium representation developed by Hirshman and co-workers over the last decade and implemented in the VMEC equilibrium code. In this paper, we use the VMEC equilibrium code and tranform the results to the straight magnetic field line coordinate system to calculate the input for the stability analysis. The accuracy of the transformation and the convergence of the equilibrium in the new coordinate system are the major points discussed in this paper. 6 refs., 1 fig.

46667 Observations of high density plasmas produced with a picosecond high power KrF laser. Willi, O. (Imperial College of Science and Technology, London (England)); Kiehn, G.; Edwards, J.; Barrow, V.; Smith, R. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

The interaction of a single picosecond, high power KrF laser pulse with solid targets has been studied using time integrated and time resolved x-ray spectroscopy. Fully ionized aluminum plasmas with temperatures of about 400 eV and densities well above 10^{23} cm^{-3} were observed when the ASE prepulse was less than 10^{-5}. 5 refs., 8 figs.

46668 Characteristics of a non-equilibrium picosecond laser plasma. Gibson, G. (Univ. of Illinois, Chicago (USA)); Rosman, R.; Luk, T.S.; McIntyre, I.A.; McPherson, A.; Wendin, G.; Boyer, K.; Rhodes, C.K. pp. 436 of Short wavelength coherent radiation: Generation and applications. Proceedings: Volume 2. Falcone, R.W.; Kirz, J. Optical Society of America, Washington, DC (1988). From 4. topical meeting on short wavelength coherent radiation: generation and applications; 26-29 Sep 1988.

VUV spectra of a highly ionized argon plasma produced by a high-power subpicosecond laser are analyzed to determine the electron temperature. The calculated electron temperature is too low to support the highest observed charge state, showing the plasma charge state distribution to be out of Saha equilibrium. 16 refs., 6 figs.

46669 (CONF-8908109–1) **Calibration of neutron detectors at the ORNL Advanced Toroidal Facility.** England, A.C.; Sumner, J.N.; Young, K.G. Oak Ridge National Lab., TN (USA). [1989]. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Neutron calibration techniques workshop; 1-3 Aug 1989. Order Number DE89015355/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The ion temperature in a maxwellian plasma containing deuterium ions can be determined by measuring the neutron rate from the plasma. This rate, coupled with a measurement of the ion density, and a measurement of the fraction of the ions that are deuterium, allows a direct determination of the ion temperature since the cross section for neutron production as a function of temperature is well known. This technique has been applied to several tokamaks and at least one stellarator and will be employed in the Advanced Toroidal Facility (ATF). ATF is a stellarator with a major radius of 2.1 m and an average minor radius of 0.27 m. The plasma in ATF is produced by microwave power at the electron cyclotron frequency. The ions are heated by hydrogen neutral beam injection with a total power $\gtrsim$2 MW, and rf power at the ion cyclotron frequency. The ATF facility has nine moderated thermal neutron detectors arrayed around its exterior in order to accurately monitor the neutron rate. The various detectors have differing efficiencies in order to allow for a wider variation in neutron source strength before count rates and statistical uncertainties limit the temperature determination. A ^{252}Cf source was inserted into ATF on the midplane of the vacuum chamber at 24 locations at a major radius of 2.1 m in order to give a good toroidal average of the count rate of the nine detectors. Each detector was calibrated to give an efficiency which is defined as the ratio of the toroidal average of the count rate to the californium source strength. When ATF operates with deuterium gas these efficiencies will be used to measure the ion temperature in the range of ~500 eV to several keV. 5 refs., 3 figs., 1 tab.

46670 (DOE/ER–0421) **Review of computer applications in the Magnetic Fusion Energy Theory Program.** USDOE Office of Energy Research, Washington, DC (USA). Applied Plasma Physics Div. Jul 1989. 22p. Sponsored by U.S. DOE Energy Research. Order Number DE89015617/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Computing plays a very important role in the magnetic fusion program, not only in theoretical studies, but in experimental and engineering work as well. Over a decade ago, the MFE program could proudly boast that it was on the cutting edge of computational

physics in such diverse areas as particle-in-cell simulation, nonlinear multidimensional MHD simulation, and Fokker-Planck calculations. New problems were being attacked and new computational methods developed in a very active and productive environment. Despite the fact that the MFE program faces enormous computational challenges, it is no longer in the vanguard of research and development in computational physics. The computational effort has lost its leadership position because it has suffered, along with the theory program in general, from a steady reduction in support. This report presents the findings and recommendations of the Committee for the Review of Computer Applications in the MFE Theory Program that was formed under the auspices of the Division of Applied Plasma Physics of the Office of Fusion Energy (OFE) of the US Department of Energy. The purpose of the review was to assess the status of computing in the theory program, examine the effectiveness with which computing resources are being used, and project the computing needs of the theory program for the future.

46671 (DOE/ER/53212–142) **Boundary effects on the MHD dynamo in laboratory plasmas.** Ho, Y.L.; Prager, S.C. Wisconsin Univ., Madison, WI (USA). Plasma Physics Research. Jul 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER53212. (CONF-8908112–1: IUTAM symposium on topological fluid mechanics, Aug 1989). Order Number DE89015207/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In recent laboratory experiments, a dynamo-like mechanism has been demonstrated in which a portion of the axisymmetric component of the magnetic field is believed to be sustained by 3D spatial fluctuations in the field and flow. With a conducting shell at the plasma surface, past MHD computation shows that sustainment arises from fluctuations which cause magnetic reconnection. If the conducting wall is retracted from the plasma surface, the fluctuations are amplified and the dynamo sustainment is still active for the times studied, but an increased energy input to the plasma is required through the applied electric field. The retraction of the conducting wall enhances the helicity dissipation rate by the intersection of the fields with the resistive surface which bounds the plasma. This enhanced helicity dissipation is balanced by the helicity injection that accompanies the increased applied electric field. 17 refs., 7 figs., 1 tab.

46672 (DOE/ER/53217–3) **Theoretical atomic physics for fusion: Annual report, 1989.** Pindzola, M.S. Auburn Univ., AL (USA). Dept. of Physics. 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER53217. Order Number DE89017363/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Electron-ion collision processes play a major role in many plasma research efforts to understand particle and energy transport in magnetic fusion experiments. We summarize our 1989 efforts in several areas of electron-ion scattering theory in this paper. 11 refs.

46673 (DOE/ER/53218–10) **Fusion plasma theory grant: Task 1, Magnetic confinement fusion plasma theory: Annual report covering the period November 16, 1988 to November 15, 1989.** Callen, J.D. Wisconsin Univ., Madison, WI (USA). Dept. of Nuclear Engineering and Engineering Physics. Jul 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-86ER53218. Order Number DE89017315/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The research performed under this grant during the current year has concentrated on key tokamak plasma confinement and heating theory issues: further development of neoclassical MHD; development of a new fluid/kinetic hybrid model; energy confinement degradation due to macroscopic phenomena in tokamaks; and some other topics (magnetics analysis, coherent structures, presheath structure). Progress and publications in these areas are briefly summarized in this report. 20 refs.

46674 (DOE/ER/53257–2) **Ion temperature gradient instability: Progress report.** Columbia Univ., New York, NY (USA). [1989]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER53257. Order Number DE89016574/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

Anomalous ion thermal conductivity remains an open physics issue for the present generation of high temperature Tokamaks. It is generally believed to be due to Ion Temperature Gradient Instability (η_i mode). However, it has been difficult, if not impossible to identify this instability and study the anomalous transport due to it, directly. Therefore the production and identification of the mode is pursued in the simpler and experimentally convenient configuration of the Columbia Linear Machine (CLM). CLM is a steady state machine which already has all the appropriate parameters, except η_i. This parameter is being increased to the appropriate value of the order of 1 by 'feathering' a tungsten screen located between the plasma source and the experimental cell to flatten the density profile and appropriate redesign of heating antennas to steepen the ion temperature profile. Once the instability is produced and identified, a thorough study of the characteristics of the mode can be done via a wide range of variation of all the critical parameters: η_i, parallel wavelength, etc.

46675 (DOE/ER/53266–25) **Kinetic effects in Alfven wave heating Part 2 propagation and absorption with a single minority species.** Li, Wann-Quan; Ross, D.W.; Mahajan, Swadesh M. Texas Univ., Austin, TX (USA). Fusion Research Center. Jun 1989. 29p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER53266. (FRCR–337). Order Number DE89016619/JAW. Available from NTIS, PC A03/MF A01; OTI; GPO Dep.

Kinetic effects of Alfven wave spatial resonances near the plasma edge are investigated numerically and analytically in a cylindrical tokamak model. In Part 1, cold plasma surface Alfven eigenmodes (SAE's) in a pure plasma are examined. Numerical calculations of antenna-driven waves exhibiting absorption resonances at certain discrete frequencies are first reviewed. From a simplified kinetic equation, an analytical dispersion relation is then obtained with the antenna current set equal to zero. The real and imaginary parts of its roots, which are the complex eigenfrequencies, agree with the central frequencies and widths, respectively, of the numerical antenna-driven resonances. These results serve as an introduction to the companion paper, in which it is shown that, in the presence of a minority species, certain SAE's, instead of heating the plasma exterior, can dissipate substantial energy in the two-ion hybrid layer near the plasma center. 11 refs., 8 figs., 1 tab.

46676 (DOE/ET/51013–271) **Confinement of multiply charged ions in an ECRH mirror plasma.** Petty, C.C. Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. Jun 1989. 170p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-78ET51013. (PFC/RR–89-9). Order Number DE89016052/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

This thesis is an experimental study of multiply charged ions in the Constance B mirror experiment. By measuring the ion densities, end loss fluxes and ion temperatures, the parallel confinement times for the first five charge states of oxygen and neon plasmas are determined. The parallel ion confinement times increase with charge state and peak on axis, both indications of an ion-confining potential dip created by the hot electrons. The radial profile of ion end loss is usually hollow due to large ion radial transport ($\tau_{\parallel} \approx \tau_{\perp i}$), with the peak fluxes occurring at the edge of the electron cyclotron resonance zone. Several attempts are made to increase the end loss of selected ion species. Using minority ICRH, the end loss flux of resonant ions increases by 20% in cases when radial transport induced by ICRH is not too severe. A large antenna voltage can also extinguish the plasma. By adding helium to an oxygen plasma, the end loss of O^{6+} increases by 80% due to decreased ion radial transport. An ion model is developed to predict the ion densities, end loss fluxes and confinement times in the plasma center using the ion particle balance equations, the quasineutrality condition and theoretical confinement time formulas. The model generally agrees with the experimental data for oxygen and neon plasmas to within experimental error. Under certain conditions spatial diffusion appears to determine the parallel ion confinement time of the highest charge states. For oxygen plasmas during ICRH, the measured parallel confinement time of the resonant ions is much shorter than their theoretical value, probably due to rf diffusion of the ions into the loss cone. 58 refs., 101 figs., 16 tabs.

46677 (DOE/ET/51013–272) **Simulation and measurement of an electron beam in a wiggler magnetic field.** Smolin, J.A. Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. Jul 1989. 95p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-78ET51013. (PFC/RR–89-11). Order Number DE89016051/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Sources of high quality beams of spinning electron beams are critical to efficient free electron devices including FELs, CARMs and gyrotrons. Bifilar helical wigglers can take a beam with little perpendicular momentum and add perpendicular momentum, spinning up the beam. The effect of the electron beam self fields on the beam quality will be important. A computer simulation has been written which can simulate the behavior of electron beams in the wiggler region including the effects of the beam self-electric fields. The equations used in the code are described. Several tests of the code are presented. Results of simulation of a bifilar helical wiggler are described. Measurement of beam parameters is also necessary. A design for a capacitive axial velocity probe is presented. The probe has been built but is still untested due to problems with a leaky flange. 15 refs.

46678 (DOE/ET/51013–273) **Massachusetts Institute of Technology Plasma Fusion Center, 1988–1989 report to the President.** Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. Jul 1989. 26p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-78ET51013. (PFC/IR–89-1). Order Number DE89016050/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report discusses the following topics on fusion energy: cold fusion; alcator confinement experiments; applied plasma physics research; fusion systems; coherent electromagnetic wave generation; and fusion technology and engineering. (LSP)

46679 (DOE/ET/53088–374) **Particle simulation in curvilinear coordinate systems.** LeBrun, M.J.; Tajima, T. Texas Univ., Austin, TX (USA). Dept. of Physics. 7 Jun 1989. 76p. Sponsored by DOE/ER;NSF. DOE Contract FG05-80ET53088. ATM-88-11128. (IFSR–374). Order Number DE89016727/JAW. Available from NTIS, PC A05/MF A01; OSTI; INIS; GPO Dep.

We present methods for particle simulation of plasmas in a nearly arbitrary coordinate metric and describe a toroidal electrostatic simulation code that evolved from this effort. A Mercier-type coordinate system is used, with a nonuniform radial grid for improved cross-field resolution. A fast iterative method for solving the Poisson equation is employed, and the interpolation/filtering technique shown to be momentum and energy conserving in the continuum limit. Lorentz ion and drift electron species are used. The code has been thoroughly tested for its reproduction of linear and nonlinear physics, and has been applied to the toroidal drift wave problem and its impact on anomalous transport in tokamaks. 40 refs., 10 figs., 1 tab.

46680 (DOE/ET/53088–385) **Theory of high-n toroidicity-induced shear Alfven eigenmode in tokamaks.** Fu, G.Y.; Cheng, C.Z. Texas Univ., Austin, TX (USA). Inst. for Fusion Studies. Jul 1989. 35p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-80ET53088;AC02-76CH03073. (IFSR–385). Order Number DE89016726/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

High-n WKB-ballooning mode equation is employed to study toroidicity-induced shear Alfven eigenmodes (TAE) in the $\delta - \alpha$ space, where $\delta = (r/q)(dq/dr)$ is the magnetic shear, and $\alpha = -(2Rq^2/B^2)(dp/dr)$ is the normalized pressure gradient for tokamak plasmas. In the ballooning mode first stability region, TAE modes are found to exist only for α less than some critical value α_c. We also find that these TAE modes reappear in the ballooning mode second stability region for bands of α values. The global envelope structures of these TAE modes are studied by WKB method and are found to be bounded radially if the local mode frequency has a maximum in radius. 15 refs., 14 figs.

46681 (DOE/ET/53088–386) **A study of runaway electron confinement and theory of neoclassical MHD turbulence.** Kwon, Oh Jin. Texas Univ., Austin, TX (USA). Inst. for Fusion Studies. Jul 1989. 150p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-80ET53088. (IFSR–386). Order Number DE89016728/JAW. Available from NTIS, PC A08/MF A01; OSTI; INIS; GPO Dep.

This thesis consists of two major studies: a study of runaway electron confinement and a theory of neoclassical MHD turbulence. The aim of the former is to study the structure of internal magnetic turbulence in tokamaks, which is thought by many to be responsible for the heat transport. The aim of the latter is to extend existing theories of MHD turbulence in tokamaks into experimentally relevant low-collisionality regimes. This section contains a theory of neoclassical pressure-gradient-driven turbulence and a theory of neoclassical resistivity-gradient-driven turbulence.

46682 (IC–88/426) **Nonlinear effects in electron cyclotron plasma heating.** Kotel'nikov, I.A.; Stupakov, G.V. International Centre for Theoretical Physics, Trieste (Italy). Dec 1988. 22p. Order Number DE89635828/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Nonlinear absorption of an ordinary wave propagating through a plasma perpendicular to unidirectional magnetic field with a frequency close to the electron gyrofrequency is studied. Electron motion is described using a Hamiltonian averaged over rapid gyromotion. The wave evolution in space and time is governed by two equations for the wave amplitude and phase averaged over the wavelength. A case of strong nonlinearity is considered in which the energy absorbed by an electron from the wave is greater than its thermal energy. For this case, the amount of absorbed power is computed analytically assuming it to be small compared with the power of the microwave beam. An effect of nonlinear refraction of the wave is discussed. (author). 17 refs, 4 figs.

46683 (INIS-BR–1597) **Magnetohydrodynamic equilibrium of axisymmetric systems with toroidal rotation.** Mansur, N.L.P. Universidade Estadual de Campinas, SP (Brazil). Inst. de Fisica. 1986. 89p. (In Portuguese). Order Number DE89635829/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

A model for studying magnetohydrodynamic equilibrium of axisymetrically confined plasma with toroidal rotation, extended to the Grad. Shafranov equation is presented. The expression used for the scalar pressure is modifiec, and the influence of toroidal magnetic field is included, The equation for general motion of axisymetrically confined plasma, particularizing for rotation movements is described. Two cases are compared: one supposes the entropy as a function of poloidal magnetic flux and other supposes the temperature as a function of flux. The equations for these two cases obtaining a simplified expression by others approximations are established. The proposed model is compared with Shibata model, which uses density as function of flux, and with the ideal spheromak model. A set of cases taking in account experimental data is studied. (M.C.K.).

46684 (INIS-SU–72, pp. 65-67) **Plasma production and heating by an ordinary wave in a stellarator in the ECR heating regime.** Andryukhina, Eh.D.; Akulina, D.K.; Batanov, G.M. and others. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR); Tsentral'nyj Nauchno-Issledovatel'skij Inst. Scientific-technical collection.* Order Number DE89780074/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2.

Investigation results of currentless plasma production and heating in the L-2 stellator at erc heating by ordinary polyrization wave are presented. The following results are obtained: with $7.1o^{12}$ cm^{-3} mean electron concentration of hydrogen plasma at the heating impulse end the central electron temperature reaches 1 keV, the central ion temperature - 80 eV, plasma energy W $\simeq$200 - 250, power lifetime - 3 ms, ion full power lifetime - 5-6 ms, gasokinetic pressure $\beta \simeq 0.25\%$, heating efficiency - 10-12 ev/(kWx10^{-13} cm^{-3}). Impurities diffusion (D$\simeq 3.10^3$ cm^2/s) is comparable with neoclassical one at erc-heating. 3 refs.; 3 figs.

Kratkie Soobshcheniya po Fizike.; no. 11.

Method of multiparticle dynamics is used to analyse dependence of thermodynamical values (density, temperature, ion charge) on time and parameters of completely ionized plasma. It is shown that these values are determined for the period of the order of interparticle distance transit time, and their dependence on plasma parameters is well described by Debye theory. 10 refs.; 2 figs.

46688 (LA-UR–89-2899) **Studies of a strongly coupled plasma produced in a capillary discharge.** Benage, J.F. Jr.; Jones, L.A.; Trainor, R.J. Jr.; Shanahan, W.R.; Shepherd, R.L.; Nothwang, D.P. Los Alamos National Lab., NM (USA). [1989]. 6p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-8908133–1: 24. Yamada conference on strongly coupled plasma physics, 29 Aug - 2 sep 1989). Order Number DE89016611/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have carried out an experiment measuring the properties of a strongly coupled ($\Gamma \sim 0.8$) plasma produced in a capillary discharge. Using an analytical model and some 1-D MHD calculations along with the measurements, we were able to determine the density, temperature, strong coupling parameter Γ, and the resistivity of this plasma. We then compared our resistivity measurements to various theories. 5 refs., 5 figs.

46689 (PPPL–2629) **Ignition probabilities for Compact Ignition Tokamak designs.** Stotler, D.P.; Goldston, R.J. Princeton Univ., NJ (USA). Plasma Physics Lab. Sep 1989. 46p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE89016932/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

A global power balance code employing Monte Carlo techniques had been developed to study the "probability of ignition" and has been applied to several different configurations of the Compact Ignition Tokamak (CIT). Probability distributions for the critical physics parameters in the code were estimated using existing experimental data. This included a statistical evaluation of the uncertainty in extrapolating the energy confinement time. A substantial probability of ignition is predicted for CIT if peaked density profiles can be achieved or if one of the two higher plasma current configurations is employed. In other cases, values of the energy multiplication factor Q of order 10 are generally obtained. The Ignitor-U and ARIES designs are also examined briefly. Comparisons of our empirically based confinement assumptions with two theory-based transport models yield conflicting results. 41 refs., 11 figs.

46690 (PPPL–2638) **TFTR: Present results and prospects for tritium operation.** Furth, H.P. Princeton Univ., NJ (USA). Plasma Physics Lab. Aug 1989. 36p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE89016021/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Experiments in TFTR are making contributions to several critical problem areas of tokamak reactor design. The magnitude of tokamak plasma transport is found to be sensitive to the shape of the density profile: central peaking may be advantageous for high-temperature tokamak confinement. For moderate-Q reactor operation, the present TFTR data base suffices to solve the three main steady-state reactor-plasma-physics problems of current drive, refueling, and impurity control. The achievement of high Q-values at high fusion power densities is being pursued in the economically promising direction of maximizing performance at moderate plasma current. In TFTR D-T plasmas, fusion reactions due to non-Maxwellian energetic-ion components will serve to generate alpha-particle populations of significant magnitude, permitting the near-term study of collective alpha-particle phenomena. 56 refs., 17 figs., 2 tabs.

46691 **Experimental study of the x-ray transitions in the heliumlike isoelectronic sequence.** Beiersdorfer, P. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550(US)); Bitter, M.; von Goeler, S.; Hill, K. W. *Physical Review [Section] A: General Physics (USA),* 40(1): 150-157 (1 Jul 1989). DOE Contract AC02-76CH03073.

The wavelengths of the transition $1s2pA^1P_1 \rightarrow 1s^2\ ^1S_0$ in heliumlike potassium, scandium, titanium, vanadium, chromium,and iron have been measuredwith an experimental precision of $\Delta\lambda/\lambda \approx 1/20\,000$.The data typically agree within error bars with recent theoretical predictionsthat include quantum electrodynamical corrections. However, the comparisonshows that there are systematic differences between data and predictions, whichindicate a need to include additional corrections in the calculations. Inparticular, it is found that the experimental wavelengths are consistentlyshorter than the calculated values by amounts which depend on the particulartheoretical prediction used in the comparison. Measurements of the wavelengthsof $\Delta n \geq 2$ x-ray transitions in heliumlike argon, scandium, titanium,vanadium, chromium, and iron are also presented.

46692 **Characterization of deposition and erosion of the TFTR bumper limiter and wall.** Mills, B.E. (Sandia National Labs., Livermore, CA (USA)); Buchenauer, D.A.; Pontau, A.E.; Ulrickson, M. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 162-164: 164 (Apr 1989). (CONF-8805285–: 8. international conference on plasma surface interactions in controlled fusion devices (PSI-8), 2-6 May 1988).

To understand material transport by the plasma in the TFTR tokamak, graphite bumper limiter tiles and metal surfaces have been studied. Detailed measurements of the TFTR inner bumper limiter POCO AXF-5Q graphite tiles indicate areas of net erosion and areas of net deposition. These areas are poloidally asymmetric and on the scale of a bay (1/20th of the torus) repeat regularly toroidally. Finer scale measurements indicate that there are subtle variations in the interaction of the plasma with the wall. Furthermore, a study of the correlation of limiter deposits with the type of discharges in TFTR indicates that the material composition depth distribution was determined by the tokamak operational history. In particular, the relative amounts of carbon, hydrogen, oxygen, and metal in the deposits changed over time, reflecting plasma impurity levels. The outer wall of the vessel was not exposed to direct plasma flux and does not show evidence of erosion. (orig.).

46693 **Transport of sputtered impurities in the vicinity of the TFTR inner bumper limiter.** McGrath, R.T. (Sandia National Labs., Albuquerque, NM (USA)); Brooks, J.N. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 162-164: 164 (Apr 1989). DOE Contract AC04-76DP00789. (CONF-8805285–:).

The generation and transport of metallic and carbon impurities on the inner bump limiter of TFTR have been investigated in detail. The spatial profiles for impurity deposition and deposited layer thickness predicted by the analytical model are compared to the extensive postplasma exposure measurements of surface conditions that have been made on the TFTR inner bumper tiles. Agreement between the analytical model and the experimental data is good. The work provides considerable insight into the dynamics of particle transport in the edge region. (orig.).

46694 **Erosion/redeposition modeling and calculations for carbon.** Brooks, J.N. (Argonne National Lab., IL (USA)); Brice, D.K.; McGrath, R.T.; DeWald, A.B. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy*

Industry (Netherlands), 162-164: 164 (Apr 1989). (CONF-8805285--: 8. international conference on plasma surface interactions in controlled fusion devices (PSI-8), 2-6 May 1988).

Several key aspects of carbon erosion/redeposition in fusion devices have been examined. These include the effects of an oblique magnetic field geometry plasma sheath on ion impingement and sputtering, and the effect of surface hydrogen buildup on sputtering. The calculations use a version of the MEASTRI hydrogen implantation code and a cloud-in-cell type sheath code. Time dependent erosion calculations have been made for the TFTR bumper limiter, using the REDEP erosion/redeposition code with updated sheath and sputtering models. The computed plasma carbon content during a TFTR limiter "deconditioning" run and for a "supershot" beam heating case is similar to measured values. The calculations predict that depletion of the near surface graphite hydrogen concentration enhances the self and hydrogen sputtering coefficients. This mechanism provides an explanation for the larger Z-effective values observed on TFTR immediately after limiter conditioning. (orig.).

46695 Modeling of spectroscopic measurements of edge recycling. Hogan, J.T. (Oak Ridge National Lab., TN (USA)); Klepper, C.C.; Hillis, D.L.; Uckan, T. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands)*, 162-164: 164 (Apr 1989). DOE Contract AC05-84OR21400. (CONF-8805285--:).

The scaling of particle confinement time with density is studied in detail First, we fit the poloidal H_α brightness distributions measured in a density scan series in the TEXT tokamak. Results of the fit suggest that there is not a monotonic decrease of the mean ionization radius with increase in density. While this detailed fitting procedure is an improvement over fitting global H_α data, it still requires the use of free parameters. We show that three-dimensional (3D) Monte Carlo calculations may be used to compute the expected H_α lineshape. As several experiments have recently reported measurement of this quantity, comparison of theoretical and measured values should allow improvement in confinement analysis. We have carried out experiments in the ORNL Plasma Materials Interaction Test Facility to measure the H_α lineshape in discharges with CH_4 injection into pure D_2 plasmas. We have observed the production of H^0 by CH_4 breakup in PMITF, and have measured the lineshape contribution due to dissociation products in a plasma environment. Finally, since many confinement studies are conducted in "carbonized" devices, we have studied the problem of determining the fueling profile in carbon-rich plasmas by calculating the H^0 deposition due to CH_4 breakup. We find that the penetration of H^0 through the scrape-off layer by CH_4 breakup should introduce a significant density scaling in the particle fueling source term. (orig.).

46696 Plasma-edge diagnostics based on Pd-MOS diodes. Bastasz, R. (Sandia National Labs., Livermore, CA (USA)); Cain, B.L.; Ruzic, D.N.; Cayton, T.E.; Hughes, R.C. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands)*, 162-164: 164 (Apr 1989). DOE Contract AC04-76DP00789. (CONF-8805285--:).

Pd metal-oxide-semiconductor (MOS) devices can be used to detect energetic hydrogen atoms. H isotopes implanted into a Pd-MOS diode quickly diffuse through the Pd layer and are accommodated at available Pd-SiO_2 interface sites, causing an increase in the leakage current through the device. We find that a diode's response to energetic hydrogen is rapid, sensitive, dosimetric, and reproducible. Pd-MOS diodes can be regenerated when saturated with hydrogen by heating to 100-200^{0}C for a few minutes. These properties make Pd-MOS diodes useful for plasma-edge diagnosis of hydrogen particle fluence when the energy distribution of the incident hydrogen is known. Pd-MOS diode sensors have been used in the laboratory and in the ZT-40M reversed-field pinch to measure energetic hydrogen fluxes. Their small size allows placement in locations inaccessible to conventional diagnostics and should provide a means for remote monitoring of hydrogen fluxes to plasma-facing surfaces. (orig.).

46697 Modeling of neutral transport and impurity generation in the Tore Supra pump limiter. Klepper, C.C. (Oak Ridge National Lab., TN (USA)); Owen, L.W.; Mioduszewski, P.K.; Grosman, A. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands)*, 162-164: 164 (Apr 1989). DOE Contract AC05-84OR21400. (CONF-8805285--:).

A system of modular pump limiters is employed in Tore Supra for particle control. It includes one large outboard module which is instrumented with an optical multi-channel analyzer viewing the neutralizer plate, in addition to pressure, temperature and particle diagnostics. The transport of neutrals in both the particle scoop mode and in the pump limiter mode with active pumping is modeled with the DEGAS code. Equilibrium neutral pressure and density, H_α-intensity at the neutralizer plate, and particle back-flow into the scrape-off layer are calculated for typical projected plasma edge conditions. Effects on neutral particle transport of varying the length of the "shelf" separating the throat region from the pumping chamber are investigated. The generation and transport of carbon impurities arising from ion impact sputtering at the neutralizer plate are estimated. The short mean-free-path for ionization of sputtered carbon atoms suggests the possibility of spectroscopically measuring the effects of poloidal flux variations arising from shadowing of the modular limiter system. (orig.).

46698 Experimental investigation of the natural divertor configuration in Heliotron-E. Hillis, D.L. (Oak Ridge National Lab., TN (USA)); Mioduszewski, P.K.; Fowler, R.H.; Rome, J.A.; Motojima, O.; Mizuuchi, T.; Noda, N.; Mutoh, T.; Zushi, H.; Takahashi, R. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands)*, 162-164: 164 (Apr 1989). DOE Contract AC05-84OR21400. (CONF-8805285--:).

Particle control with pump limiters and divertors has been successfully demonstrated in a number of present-day tokamaks. In a heliotron/stellarator configuration, plasma flows to the wall in distinct flux bundles, often called "divertor stripes". This complicated three-dimensional characteristic of the plasma edge presents a new challenge for active particle control systems such as pump limiters and divertors. The experiment described here has obtained data with an instrumented pumped particle collector that is located in the "natural" magnetic divertor stripe of Heliotron-E. The particle collector consists of a moveable graphite assembly with single-sided particle collection and active pumping. By scanning the particle collector assembly through the plasma edge of Heliotron-E, the divertor stripe is observed to be about 2-3 cm (fwhm) in width, and pressure rises of 0.1-0.2 mTorr are observed in the particle collector pumping chamber. These measurements have demonstrated that particles leaving the bulk plasma via the divertor stripes can be collected and provide a basis for developing a divertor scheme for particle control in helical systems. Modeling of the Heliotron-E magnetic configuration at the plasma edge is used to determine the collection efficiency of the particle collector in the divertor stripes. The modelling is further extended to describe a helical divertor concept. (orig.).

46699 The interaction of tritium with graphite and its impact on tokamak operations. Causey, R.A. (Sandia National Labs., Livermore, CA (USA)). *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands)*, 162-164: 164 (Apr 1989). (CONF-8805285--: 8. international conference on plasma surface interactions in controlled fusion devices (PSI-8), 2-6 May 1988).

The state of knowledge of tritium retention in graphite and how it affects the operation of tokamak fusion reactors is reviewed. The retention of tritium in the saturated surface layer exposed to the plasma, retention in the surface connected porosity, retention in the graphite grains, and retention in the co-deposited carbon/tritium layer are discussed along with an assessment of the relative importance of each component for fusion reactors. Data on the diffusivity and solubility of tritium in graphite are analyzed to pick the "best estimate" for both of these parameters. Tritium trapping in graphite is considered along with an explanation for its cause and an estimate of its magnitude. (orig.).

46700 Characterization of sub-10-μm 30-ps flash duration point sources for x radiography. Failor, B. H. (KMS Fusion, Inc., Ann Arbor, Michigan 48106(US)); Gabl, E. F.; Johnson, R. R.; Shepard, C. *Journal of Applied Physics (USA)*, 66(4): 1571-1578 (15 Aug 1989). DOE Contract AC03-87DP10560.

Flash x radiography can provide important information about high-density, high-opacity plasmas. Experiments at KMS investigated the

characteristics of point x-ray sources produced when coated fibers, wires, and mounted particles were irradiated with high intensity ($I > 10^{16}$ W/cm^2) green laser light. The target materials Bi, CsI, Au, and Ag were evaluated in the areas of (1) the spatial and temporal resolutions that can be achieved, (2) the effect of source size and laser pulse duration on x-ray signal strength, and (3) the practical considerations associated with using the technique to actually obtain radiographs of accelerated polyvinyl alcohol shells.

46701 (AD-A–208129/7/XAB) **Experimental and numerical studies of laser-sustained gas plasmas. Final report, 1 February 1988-15 March 1989.** Mazumder, J.; Krier, H.; Mertogul, A.; Schwartz, S.; Chen, X. Illinois Univ., Urbana, IL (USA). Dept. of Mechanical and Industrial Engineering. Apr 1989. 88p. (UILU-ENG–89-4005). Available from NTIS, PC A05/MF A01.

Laser propulsion is the production of high-specific-impulse rocket thrust using a high-power laser as a remote energy source. Specific impulses in excess of 1000 seconds are achievable because propellant temperatures are very high and low-molecular-weight gases can be used. This report focuses on the energy-conversion mechanisms of laser-sustained plasmas in pure flowing argon and argon/helium mixtures. Experiments at very high argon mass flux (55 kg/m2s) and pressure as high as 2.5 atmospheres were performed. The results indicate that nearly all the laser power can be absorbed (>97%), and efficiencies approaching 50% can be obtained. Experiments with mixtures of argon and helium indicate that the high specific heat and thermal conductivity of the helium tends to allow for more of the absorbed energy to be retained rather than reradiated to the chamber walls. This despite the fact that the very high ionization energy of helium limits the global absorption to values below that for pure argon plasmas. Fundamental research concerning laser-sustained plasmas such as the independent experimental determinations of electron number density and electron temperature is required. This will allow the evaluation of the local thermal equilibrium which is needed in order to better interpret the spectroscopic and numerical results. Also required is the more accurate determination of downstream plasma exhaust gas temperature via Rayleigh scattering thermometry. This technique is impervious to plasma and laser irradiation interferences and to gas heat loss to the chamber walls, thus thermal-efficiency calculations will be much more accurate than in the past.

46702 (CONF-890850–1) **Propagation of normal zones of finite size in large, composite superconductors.** Dresner, L. Oak Ridge National Lab., TN (USA). [1989]. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 11. international conference on magnet technology; 28 Aug - 1 sep 1989. Order Number DE89016866/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Very large, composite superconductors have been proposed for use in energy storage magnets. A typical conductor, rated at 230 kA, has been discussed by J. Waynert, Y. Eyssa, and X. Huang, namely, a 6-cm aluminum cylinder with superconducting filaments on its outer surface. Owing to its large size and nonuniform distribution of filaments, such a conductor can sustain normal zones of finite size that travel at a uniform velocity along the conductor. This paper presents a simple, analytical model that permits determination of the conditions under which such zones can exist and the size and velocity of such zones. It has been shown that the transport current has a threshold value below which finite normal zones cannot exist and that the propagation velocity corresponding to this threshold current, though not zero, is the smallest possible. 1 ref., 3 figs.

46703 (DOE/ET/51013–T214) **Upgrade of a fusion accident analysis code and its application to a comparative study of seven fusion reactor designs.** Porter, L.J. Massachusetts Inst. of Tech., Cambridge, MA (USA). Plasma Fusion Center. Jun 1989. 112p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-78ET51013. (PFC/RR–89-10). Order Number DE89016059/JAW. Available from NTIS, PC A06/MF A01 - OSTI.

Fusion energy has the potential to be a safe and environmentally favorable energy source. The importance of safety necessitates the existence of a computer code having the capability of assessing offsite impacts resulting from postulated fusion reactor accidents. The FUSCRAC3 computer code has been developed for this purpose. FUSCRAC3 calculates doses resulting from inhalation, groundshine, and cloudshine for 259 isotopes as well as doses resulting from ingestion for 145 isotopes. FUSCRAC3's data base includes the most up-to-date dose conversion factors for all four exposure pathways as well as the most current environmental transfer factors for the ingestion pathway. This work presents a detailed description of the modifications made to the existing fusion reactor accident code, FUSCRAC2, in the development of the more advanced FUSCRAC3 computer code. Also included is a report of the validation procedures. Finally, the improved computer code was applied in two ways: to provide a general data base presenting rem per curie data for each isotope and to assess the doses resulting from possible releases from the reactors evaluated in the ESECOM study. Regarding the latter application, it was found that the general trends established in the original study remained unchanged. However, it was determined that the inclusion of the ingestion pathway substantially affects the overall chronic dose. Isotopes of particular interest due to the ingestion contribution include H-3, Ca-45, Fe-55, and Po-210. 12 refs., 2 figs., 12 tabs.

46704 (EUR–11705, pp. 157-164) **Considerations on ECFH current drive and bootstrap current for W VII-X.** Gasparino, U. (Max-Planck-Institut fuer Plasmaphysik, Garching-Muenchen (DE)); Maassberg, H. Commission of the European Communities, Luxembourg (Luxembourg). 1988. (CONF-8806386–: 2. workshop on Wendelstein VII-X, 13-16 Jun 1988). In *Proceedings of the 2. Workshop on Wendelstein VII-X.* Order Number DE89634438/JAW. Available from NTIS (US Sales Only), PC A24/MF A01.

Low shear is the characteristic of all proposed Wendelstein VII-X configurations. To avoid low harmonic rational numbers within the rotational transform profile, the current contribution to the rotational transform, $\Delta\iota_s \alpha\ I/B$, should be typically less than 10%. This leads to an upper limit of 50 kA (at B = 2.5 T) for the tolerable net toroidal current. A considerable net toroidal current (bootstrap current) is expected by neoclassical theory in the plateau and the low-collisionality regimes. Both radial transport as well as the bootstrap current densities depend sensitively on the magnetic configuration (see A. Montvai, this workshop). In case of an axisymmetric configuration with dimension and plasma parameters as predicted for the high-$< \beta >$ regime of WVII-X ($< \beta > \sim$ 5%), this current ($\sim$ 0.5/1 MA) would dominate the rotational transform profile. This requires a reduction of magnitude of the bootstrap current to some % of the value of an equivalent tokamak. This reduction must act on the current profile itself and should not be merely obtained by having two channels of currents of different sign at different radii. Due to the possibility of controlling absorbed power and driven current profiles, electron cyclotron waves are a natural candidate for current profile control. Linear calculations show the possibility to drive a counteracting current with a profile similar to the bootstrap one. For $< \beta >$ $\sim$ 5% conditions, however, the optimium current drive efficiency (eta $\sim$ 10 kA per MW) is far too low to make ECF-current drive suitable.

46705 (IAEA-TECDOC–495, pp. 35-49) **Maintenance of JT-60.** Shimizu, M. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Energy Research Establishment). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The objectives of JT-60 are to achieve and investigate hydrogen plasmas with equivalent Q=1 conditions and to make an integrated test of fusion technologies required for the next stage of advancement. JT-60 is composed of numerous components of the tokamak machine, the vacuum pumping system, the power supply system, the heating system, and the control system etc. JT-60 has been successfully in operation since April '85. It is owing to deliberate design, careful fabrication and maintenance and speedy trouble

shooting. For instance, the bolted first wall is easily changeable and monitored during operation period in vacuum by the in-vessel inspection system, so as to shorten the period of shut down. Several kinds of criteria are settled for electrical insulation and vacuum control etc., and strictly applied for actual operation and maintenance. (author). 13 refs, 13 figs, 3 tabs.

46706 (IAEA-TECDOC–495, pp. 51-62) **Maintenance approach and remote equipment design for FER.** Tachikawa, K. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Energy Research Establishment); Adachi, J.; Iida, H.; Kobayashi, T.; Miki, N.; Saito, R.; Yamada, M. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The latest FER remote maintenance concept and various remote equipments design are described. Reactor concept of the FER is decided based primarily on tradeoffs between reliability of maintenance scheme and minimization of capital costs. Key features of the FER structure are: (1) the most reliable maintenance procedure, (2) optimization of PF coil allocation, (3) installation of sacrificed "guard limiter" on the inboard first wall area against off-normal conditions, and (4) reliable and simple shielding structure (water-tank type shield). Local guard limiters are designed to be easily replaceable without breaking a plasma vacuum. Outboard shield and divertor modules are planned to be removed by horizontal access with reliable single straight-line motion. Transfer casks are prepared for the containment of tritium and activated debris during transportation. As for equipments, design study puts emphasis upon the "inboard/outboard limiter handling equipments", "transfer cask for tritium/radioactive debris", and "in-vessel manipulator system for inspection". This paper consists of general description of the FER, design philosophy, design conditions, maintenance procedure, remote handling equipments, repair facility, and urgent R and D issues/JAERI's R and D programme for remote handling. (author). 7 refs., 6 figs., 3 tabs.

46707 (IAEA-TECDOC–495, pp. 75-87) **Maintenance concepts for NET.** Holloway, C. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)); Salpietro, E. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Remote maintenance of NET in-vessel and ex-vessel components is described together with concepts for the maintenance equipment. The application of robotic devices and tele-manipulators to the servicing of fusion machines is discussed. It is concluded that, except for certain well defined situations, the unpredictable nature of the maintenance requirements are best suited by the flexibility of the tele-manipulator. (author). 7 refs, 6 figs.

46708 (IAEA-TECDOC–495, pp. 91-94) **Remote maintenance concepts for nuclear plants.** Boehme, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Ingenieurtechnik). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The importance of remote maintenance in nuclear plants is increasing. Remote replacement of components to be maintained is preferred to in-place repair. Overhead bridge cranes in combination with an impact wrench are used as remote tools for the operation of specially developed remote connectors. Other concepts prefer the use of manipulators and commercially available connectors. The replaced components can be maintained or dismantled by electrical master slave manipulators and adapted tools. Remote maintenance of the maintenance equipment itself has to be provided and sometimes redundant systems are required for the case of failures or accidents. (author). 6 refs.

46709 (IAEA-TECDOC–495, pp. 63-74) **JET remote maintenance system.** Raimondi, T. (Commission of the European Communities, Abingdon (UK). JET Joint Undertaking). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

One of the main objectives of JET is to reach near ignition conditions in D-T phase during an operational period of two years, when remote maintenance will be needed due to neutron activation. The maintenance criterion has been to replace rather than repair faulty components. The machine is segmented so that in case of major failure an octant can be replaced. To achieve a high degree of reliability, established technology has been applied throughout and in particular to vaccum, fluid and electrical connections, which are defined and standardised in the remote handling manual. To cope with the complexity and unpredictability of the tasks likely to be required, a flexible system, consisting of general purpose handling devices positioned by large transporters and supplemented by special tools, has been adopted. For remote operations within the vacuum vessel the transporter is an articulated boom which can reach all around the torus through a horizontal port. It carries either a manipulator or end-effectors for handling heavy components. Outside the vessel a crane-mounted telescopic mast will position a manipulator all around the machine, working in combination with lifting facilities provided by the main hook of the crane or by an auxiliary jib crane mounted on the telescopic mast, and in areas not accessible from above, by a low-level transporter. Periodic inspections of the interior of the vessel have to be done to check for damage due to plasma disruptions. Our system scans the vessel under vacuum using four TV probes through small apertures in the top of the vessel and can work at operating temperature (300 deg. C). Remote handling specialists vet the design of all systems classified as requiring remote handling, and prepare procedures for the envisaged maintenance. Mock-up tests lead to the identification of special tools and computer-aided techniques which may be needed.

46710 (IAEA-TECDOC–495, pp. 141-149) **Investigations of in-vessel handling concepts for NET.** Suppan, A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Ingenieurtechnik); Huebener, J. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Up to a weight of 1 ton NET in-vessel components will be handled by means of handling units which enter the torus through four horizontally arranged ports. The in-vessel handling unit (IVHU) consists of a radially movable carrier, an articulated boom extendable to about 25 m and suitable to reach any point of the torus. Three work units are optionally attachable to the end-frame of the boom. Components and equipment will be transferred by a carrier with telescopic arm. Plug handling devices are foreseen to open and close the entry ports. The equipment is housed in contained transfer units permanently attached to the ports and transferable via transport flasks to a service area. IVHU-carrier and articulated boom are connected by a combined yaw and roll joint. The 11 links of the boom are modular designed. Each of their yaw links is moved by two motor driven planetary roller spindles which actuate in series. The drives are externally arranged at the upper side of the links. Supply lines are routed inside the link boxes. A combined pitch and roll joint allows the end-frame adjustment. Three types of work units were investigated. An electrical master slave manipulator

unit and two devices for the replacement of radiofrequency antennae and divertor plates. The IVHU can be controlled manually and automatically. Designing an experimental device for in-torus handling with an IVHU as a principal item has been launched. (author). 4 refs, 7 figs, 1 tab.

46711 (IAEA-TECDOC–495, pp. 189-197) **Development of elemental techniques for in-vacuum remote manipulators of fusion devices.** Obara, K. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Energy Research Establishment); Murakami, Y. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

A number of works have been done at JAERI to develop elemental techniques for in-vacuum manipulators through the process of fabrication and performance test of an in-situ coating machine, a leak hunting device and a multi-joint remote handling machine. Major technical problems encountered in the course of the development are the selection of driving methods, improvement of lubricating materials and mitigation of outgassing from constructional materials. The purpose of the in-situ coating machine is to inspect and repair the eroded or damaged surface of TiC-coated tiles in the JT-60 vacuum vessel. The machine basically consists of an in-vacuum manipulator with a long arm of four degrees of freedom, a quartz fiberscope and ohmically heated titanium evaporators. The leak hunting device is composed of a light-weighted manipulator and a small ionization gauge attached to the tip of the manipulator arm. Leak points can be located by moving the ionization gauge along the inner wall of the test vessel. In the above two applications, MoS_2-coated Inconel (or stainless steel) is used for most movable parts including gears, Ag-ionplated stainless steel for ball bearings, and a self-lubricating alloy for slide bearings. A preliminary test was also made of an in-vacuum remote handling machine with multi-joint arms. In this case, each joint has its own driving unit consisting of electric motor, torque sensor, electronic circuit for control, gears, bearings, etc., and is exposed to a high vacuum. A special hydrocarbon grease is used as the lubricant since no solid lubricating materials endure the strong forces fallen on the gears of the joint. (author). 7 refs, 8 figs, 1 tab.

46712 (IAEA-TECDOC–495, pp. 249-260) **Towards more automation for remote maintenance.** Benner, J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung); Fischer, C.; Leinemann, K.; Stratmanns, E.; Till, W. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The CATROB telerobotic system as a kinematical prototype for remote handling in hazardous environments like a fusion reactor is described. It consists of an industrial robot, mounted on a gantry crane with two degrees of freedom. The basic functional principle of this system is the synthesis of sensory-guided automatic and operator-controlled manual operation in order to minimize the time needed for performing remote maintenance and inspection. The goal is to automize all preplannable operations and to support the operator in performing manual remote handling by a graphics based simulation system. In the present state, automatically bolting and unbolting of flanges and handling of plug connections is realized with CATROB. In the paper the software and hardware architecture of the system and its sensory equipment are described, and some preliminary results on the system performance are reported. (author). 12 refs, 10 figs.

46713 (INIS-BR–1623) **Heat transfer phenomena in the first wall of the RFX fusion experiment.** Oliveira Pauletti, R.M. de. Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro, RJ (Brazil). Dec 1988. 4p. (CONF-8812106–: 2. National Meeting of Thermal Science, 6-8 Dec 1988). Order Number DE89635841/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The thermal analysis of the first wall (FW) of the RFX machine is presented. RFX is a large fusion experiment under construction at Padua, Italy. The RFX FW is briefly described, together with the critical thermal conditions. The numerical analyses performed to predict the FW thermal behaviour are presented. 1-D and 2-D finite element models give accurate predictions of the FW temperatures and of the thermal exchanges in the machine environment. (author).

46714 (IPPJ-T–37) **Proceedings of the Japan-U.S. workshop P-119 on 14 MeV neutron source for material R and D based on plasma devices.** Miyahara, A.; Coensgen, F.H. (eds.). Nagoya Univ. (Japan). Inst. of Plasma Physics. Jun 1988. 412p. (CONF-8806400–: Japan-U.S. workshop P-119 on 14 MeV neutron source for material R and D based on plasma devices, 7-10 Jun 1988). Order Number DE89906613/JAW. Available from NTIS (US Sales Only), PC A18/MF A01.

In addition to the development of an adequate means to contain reacting D-T plasma in the range of 100 million deg K, the successful development of nuclear fusion as an energy source requires the development of new long-lived, low-activation materials. These new fusion reactor materials should not become radioactive when subjected to intense neutron irradiation for a long period. If the induced radioactivity cannot be entirely avoided, it must be short-lived and at relatively low level. The material development is already in progress using existing fission irradiation facilities and low level 14 MeV neutron sources. But the final selection and qualification of fusion reactor materials will require end of life testing. The neutron irradiation facilities for this purpose, the approximation of D-T neutron spectrum and the design of fusion material irradiation test (FMIT) are discussed. The workshop P-119 was organized to promote the development of plasma-based neutron sources. The presentation of each concept included its physics basis, neutron field characteristics, the required research and development and their schedules, and the rough estimation of the costs for development, construction and operation. (K.I.).

46716 (LA-UR–89-2489) **The reversed-field-pinch (RFP) fusion neutron source: A conceptual design.** Bathke, C.G.; Krakowski, R.A.; Miller, R.L.; Werley, K.A. Los Alamos National Lab., NM (USA). 1989. 25p. Sponsored by U.S. DOE Energy

Research. DOE Contract W-7405-ENG-36. (CONF-8902118–2: International Energy Agency workshop on fusion materials irradiation facilities, 14-17 Feb 1989). Order Number DE89015297/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The conceptual design of an ohmically heated, reversed-field pinch (RFP) operating at ~5-MW/m^2 steady-state DT fusion neutron wall loading and ~124-MW total fusion power is presented. These results are useful in projecting the development of a cost effective, low input power (~206 MW) source of DT neutrons for large-volume (~10 m^3), high-fluence (3.4 MW yr/m^2) fusion nuclear materials and technology testing. 19 refs., 15 figs., 9 tabs.

46717 (LA-UR–89-2782) **ANTHEM simulation of the early time magnetic field penetration of the plasma surrounding a high density Z-pinch.** Mason, R.J. Los Alamos National Lab., NM (USA). 1989. 7p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8904107–8: 2. international conference on high-density pinches (ICHDP-2), 26-28 Apr 1989). Order Number DE89016980/JAW. Available from NTIS, PC A02/MF A01; OSTI; INIS; GPO Dep.

The early time penetration of magnetic field into the low density coronal plasma of a Z-pinch fiber is studied with the implicit plasma simulation code ANTHEM. Calculations show the emission of electrons from the cathode, pinching of the electron flow, magnetic insulation of the electrons near the anode, and low density ion blow off. PIC-particle ion calculations show a late time clumping of the ion density not seen with a fluid ion treatment. 4 refs., 4 figs.

46718 (N–89-23300) **Development and simulation study of a new inverse-pinch high Coulomb transfer switch. Final report.** Choi, S.H. Information and Control Systems, Inc., Hampton, VA (USA). May 1989. 42p. (NASA-CR–181768;FR–688102;NAS–1.26:181768). Available from NTIS, PC A03/MF A01.

The inverse-pinch plasma switch was studied using a computer simulation code. The code was based on a 2-D, 2-temperature magnetohydrodynamic (MHD) model. The application of this code was limited to the disk-type inverse-pinch plasma switch. The results of the computer analysis appear to be in agreement with the experimental results when the same parameters are used. An inverse-pinch plasma switch for closing has been designed and tested for high-power switching requirements. An azimuthally uniform initiation of breakdown is a key factor in achieving an inverse-pinch current path in the switch. Thus, various types of triggers, such as trigger pins, wire-brush, ring trigger, and hypocycloidal-pinch (HCP) devices have been tested for uniform breakdown. Recently, triggering was achieved by injection of a plasma-ring (plasma puff) that is produced separately with hypocycloidal-pinch electrodes placed under the cathode of the main gap. The current paths at switch closing, initiated by the injection of a plasma-ring from the HCP trigger are azimuthally uniform, and the local current density is significantly reduced, so that damage to the electrodes and the insulator surfaces is minimized. The test results indicate that electron bombardment on the electrodes and the insulator surfaces is minimized. The test results indicate that electron bombardment on the electrodes is four orders of magnitude less than that of a spark-gap switch for the same switching power. Indeed, a few thousand shots with peak current exceeding a mega-ampere and with hold-off voltage up to 20 kV have been conducted without showing measurable damage to the electrodes and insulators.

46719 (ORNL/FTR–2820) **[US/Japan collaborative program using the High Flux Isotope Reactor (HFIR) for irradiation of fusion reactor structural materials]: Foreign trip report, February 14, 1988–February 20, 1988.** Bloom, E.E. Oak Ridge National Lab., TN (USA). 7 Mar 1988. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017301/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Discussions were held with JAERI staff, led by Dr. T. Kondo, for the purpose of reviewing progress on the US/Japan Collaborative Fusion Materials Program using the HFIR, to update our Japanese partners on the status of HFIR, and to develop a scenario for continuation of the collaboration on HFIR restart. Important results on the effect of He/dpa ratio on irradiation-induced swelling and creep recently obtained from the ORR/HFIR spectral tailoring experiments were reviewed. These results reinforce the need for continuation of the program planned for the HFIR RB facility. The Japanese are clearly concerned about the continuing shutdown of HFIR. The US/Japan collaborative program is a key part of their total program to develop and qualify a material for use in the Japanese Fusion Experimental Reactor (FER). Because no plan or schedule for restart of HFIR has been agreed upon by ORNL and DOE, it was arbitrarily decided to develop a scenario for the second five years of the collaborative program based upon the assumption that HFIR will restart on October 1, 1988.

46720 (ORNL/FTR–2839) **Workshop on the effects of recoil spectrum and nuclear transmutations on the evolution of the microstructure: Foreign trip report, March 22, 1988–March 28, 1988.** Pedraza, D.F. Oak Ridge National Lab., TN (USA). 13 Apr 1988. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89017284/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The workshop opened with three nonscientific presentations. First, the activities of the recently created Paul Scherrer Institute were described. Next followed a short welcome by the EURATOM representative. Third, the present status of the NET (the Next European Torus) Materials Program was described by Dr. Nihoul, of the NET-Team. The scientific program that followed can be subdivided into two groups which covered the two subjects of the workshop, namely, those related to the displacement cascade effects, and those related to nuclear transmutations, mainly helium. The quality of the presentations was generally high, representing especially the ongoing efforts in the scientific community to achieve an advanced understanding of the geometry and dynamics of displacement cascades both theoretically and experimentally. This subject is not only of interest to the fusion energy programs but to the entire radiation effects community. The importance of this field of research is focused in the formulation of valid fission-fusion correlations concerning microstructural evolutions that spectra. It was argued that an assessment of the effects of helium when establishing these correlations is vital.

46721 (PNL-SA–16438) **Radioactive waste disposal for fission and fusion reactors.** Heinisch, H.L.; Doran, D.G. Pacific Northwest Lab., Richland, WA (USA). [1989]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC06-76RL01830. Order Number DE89016047/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The calculated radioactive waste inventories of the Turkey Point pressurized water fission reactor (PWR) and the Starfire conceptual fusion tokamak are compared as a function of time from initial start-up to 10,000 years after decommissioning. Only material out of reactor at least one year is considered. The total activity in Ci/W(th) of the Starfire tokamak is slightly greater than that of the PWR during the active lifetimes of the two reactors and beyond 1000 years. However, using reduced activation materials in Starfire can result in about 1/2000 as much long-lived radioactivity as in the fission reactor. It is stressed that comparison of wastes on this basis is not straightforward, since the radioisotopes and methods required for their disposal are different for fusion and fission reactors. 2 refs., 1 fig., 2 tabs.

46722 (PPPL–2642) **A comparison of hydrogen vs. helium glow discharge effects on fusion device first-wall conditioning.** Dylla, H.F. Princeton Univ., NJ (USA). Plasma Physics Lab. Sep 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. (CONF-8904230–4: AVS topical conference on surface conditioning of vacuum systems, 3-7 Apr 1989). Order Number DE89016954/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

Hydrogen- and deuterium-fueled glow discharges are used for the initial conditioning of magnetic fusion device vacuum vessels following evacuation from atmospheric pressure. Hydrogenic glow discharge conditioning (GDC) significantly reduces the near-surface concentration of simple adsorbates, such as H_2O, CO, and CH_4, and lowers ion-induced desorption coefficients by typically three orders of magnitude. The time evolution of the residual gas production observed during hydrogen-glow discharge conditioning of the carbon first-wall structure of the TFTR device is similar to the time evolution observed during hydrogen GDC of the initial first-wall configuration

in TFTR, which was primarily stainless steel. Recently, helium GDC has been investigated for several wall-conditioning tasks on a number of tokamaks including TFTR. Helium GDC shows negligible impurity removal with stainless steel walls. For impurity conditioning with carbon walls, helium GDC shows significant desorption of H_2O, CO, and CO_2; however, the total desorption yield is limited to the monolayer range. In addition, helium GDC can be used to displace hydrogen isotopes from the near-surface region of carbon first-walls in order to lower hydrogenic retention and recycling. 38 refs., 6 figs.

46723 (SAND–89-0901) **Design considerations for ITER [International Thermonuclear Experimental Reactor] plasma facing components.** McGrath, R.T.; Koski, J.A.; Watson, R.D.; Causey, R.A.; Croessmann, C.D.; Dempsey, J.F.; Hosking, M.; Neimer, K.A.; Russo, A.J.; Salmonson, J.C.; Stephens, J.; Smith, M.F.; Watkins, J.G.; Whitley, J.B. Sandia National Labs., Albuquerque, NM (USA). Jul 1989. 110p. Sponsored by U.S. DOE Energy Research. DOE Contract AC04-76DP00789. Order Number DE89015200/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The International Thermonuclear Experimental Reactor (ITER) is a joint design and R&D project involving the USA, the Soviet Union, Japan and the European Community. These international partners are working together on the design of a fusion tokamak reactor that will operate in the D-T ignition regime. This report compiles the contributions to ITER made by Sandia National Laboratories in the area of design and R&D for plasma facing components, such as the first wall and divertor. The following topics are discussed: divertor fabrication issues, divertor thermal-hydraulic analysis, separatrix sweeping effects, divertor tile 2-D stress analysis, electromechanical disruption effects, runaway electron and intense energy deposition analyses, lifetime analysis and tritium retention in plasma facing materials. Material properties for pyrolytic graphite and beryllium are presented. Use of pyrolytic graphite as the plasma facing material allows for operation with thicker graphite armor at the design heat flux level of 10 MW/m^2. The design of a divertor coated with plasma sprayed beryllium is presented as an attractive alternative to pyrolytic graphite armor tiles. Finally, the Sandia research and development plan for ITER is discussed. 82 figs.

46724 (UCLA/PPG–1247) **PISCES program plasma-surface interactions research: Summary of research, 1988–1989.** California Univ., Los Angeles, CA (USA). Inst. for Plasma and Fusion Research. May 1989. 51p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-86ER52134. Order Number DE89015622/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

This paper discusses the following about the Pisces program: Major objectives of the program; Staff in the PISCES program at UCLA; Highlights in the program; Collaborations with other institutions; PISCES-A facility; PISCES-B facility; Fast scanning Langmuir probe; Omegatron mass spectrometer; Spectroscopic diagnostics; Data acquisition system; Redeposition effect on carbon chemical erosion; Erosion of carbon tokamakium from TFTR; Effect of boron-doping on carbon chemical erosion; Radiation enhanced sublimation of carbon; Surface analysis of TEXTOR titles; Spectroscopic analysis of carbon impurities; Biased limiter and divertor; Biased divertor channel; Gaseous divertor experiments; Presheath profile measurements; Particle transport in CCT tokamak; and Biased divertor experiments in CCT.

46725 (UCRL–100798) **Low-density carbonized composite foams for direct-drive laser ICF targets.** Kong, Fung-Ming. Lawrence Livermore National Lab., CA (USA). Mar 1989. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890902–6: 198. American Chemical Society national meeting, 10-15 Sep 1989). Order Number DE89012328/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The design for a direct-drive, high-gain laser inertial confinement fusion target calls for the use of a low-density, low-atomic-number foam to confine and stabilize liquid deuterium-tritium (DT) in a spherical-shell configuration. Over the past two years, we have successfully developed polystyrene foams (PS) and carbonized resorcinol-formaldehyde foams (CRF) for that purpose. Both candidates are promising materials with unique characteristics. PS has superior mechanical strength and machinability, but its relatively large thermal contraction is a significant disadvantage. CRF has outstanding wettability and dimensional stability in liquid DT; yet it is much more fragile than PS. To combine the strengths of both materials, we have recently developed a polymer composite foam which exceeds PS in mechanical strength, but retains the wettability and dimension stability of CRF. This paper will discuss the preparation, structure, and properties of the polymer composite foams. 5 refs., 1 fig., 1 tab.

46726 Collector probe measurements of ohmic conditioning discharges in TFTR. Kilpatrick, S.J. (Princeton Univ., NJ (USA). Plasma Physics Lab.); Dylla, H.F.; Manos, D.M.; Cohen, S.A.; Wampler, W.R.; Bastasz, R. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands)*, 162-164: 164 (Apr 1989). DOE Contract AC02-76CH03073;AC04-76DP00789. (CONF-8805285–: 8. international conference on plasma surface interactions in controlled fusion devices (PSI-8), 2-6 May 1988).

Special limiter conditioning techniques using low density deuterium or helium discharges have produced enhanced plasma confinement in TFTR. Measurements with a rotatable collector probe have been made to increase our understanding of the boundary layer during these conditioning sequences. A set of silicon films behind slits facing in the ion and electron drift directions was exposed to four different D^+ and He^{2+} discharge sequences. The amounts of deuterium and impurities trapped in the surface regions of the samples have been measured by different analytical techniques, including nuclear reaction analysis for retained deuterium, Rutherford backscattering spectroscopy for carbon and metals, and Auger electron spectroscopy for carbon, oxygen and metals. Up to 1.9×10^{17} cm^{-2} of deuterium was detected in codeposited carbon layers with D/C generally in the range of the bulk saturation limit. Radial profiles and ion drift/electron drift asymmetries are discussed. (orig.).

46727 Release of deuterium from carbon during low-energy helium and carbon ion bombardment. Wampler, W.R. (Sandia National Labs., Albuquerque, NM (USA)); Doyle, B.L. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands)*, 162-164: 164 (Apr 1989). (CONF-8805285–:).

Ion-induced release of deuterium (D) from carbon was investigated as a possible mechanism for the supershot conditioning in TFTR. Carbon was implanted to saturation with 300 eV D and then bombarded with 0.6 and 1.2 keV helium ions and 3 keV carbon ions. Nuclear reaction analysis was used to monitor the areal density of D remaining in the samples during the ion bombardment. Initial D release rates up to 10 D atoms per incident ion were observed. The amount of D that can be removed by ion-induced release from the TFTR limiter is similar to the pumping capacity produced by supershot-conditioning. A model for removal of D from the limiter by ion-induced release is described which agres with observed D removal during supershot conditioning in TFTR. (orig.).

46728 Helium-Ion-Induced release of hydrogen from graphite. Langley, R.A. (Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands)*, 162-164: 164 (Apr 1989). DOE Contract AC05-84OR21400. (CONF-8805285–: 8. international conference on plasma surface interactions in controlled fusion devices (PSI-8), 2-6 May 1988).

The ion-induced release of hydrogen from AXF-5Q graphite was studied for 300- to 500-eV helium ions. The hydrogen was implanted into the graphite with a low energy ($\simeq$ 200 eV) and to a high fluence. This achieved a thin ($\simeq$ 10 nm),saturated near-surface region. The release of hydrogen was measured as a function of helium fluence. A model that includes ion-induced detrapping, retrapping, and surface recombination was used to analyze the experimental data. The release cross section varied from 1.8×10^{-16} cm^2 at 300 eV to 1.4×10^{-16} cm^2 at 500 eV, while the depletion depth varied from 0.8 nm at 300 eV to 1.2 nm at 500 eV. (orig.).

46729 Hydrogen Ion-driven permeation in carbonaceous films. Anderl, R.A. (Idaho National Engineering Lab., Idaho Falls (USA)); Holland, D.F.; Longhurst, G.R. *Journal of Nuclear Materials,*

on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands), 162-164: 164 (Apr 1989). DOE Contract AC07-76ID01570. (CONF-8805285--:).

This paper presents the results of investigations into the permeation properties of amorphous carbonaceous, a-C:H, films produced by plasmachemical deposition techniques. Carbonaceous films on iron substrates with thickness ranging from 60 nm to 110 nm were subjected to high fluence implantations with mass analyzed D_3^+ ions with energies ranging from 600 eV to 3000 eV and fluxes ranging from $5x10^{14}$ D/cm^2 s to $5x10^{15}$ D/cm^2 s, respectively. Deuterium re-emission upstream, deuterium permeation downstream and secondary ions sputtered from the implantation surface were measured as a function of implantation fluence for specimens at 420 K. The present studies indicate that the a-C:H film permeability is directly related to the time, hence the fluence, required to achieve isotopic replacement and saturation of the deuterium ion beam atoms stopped in the implant region. Once the deuterium saturation level is achieved in the layer, a significant fraction of the implanting ions can result in permeation. For the present experiment, this permeation factor was much higher than that for uncoated iron specimens subjected to similar beam conditions. Carbon sputter yields of 0.008-0.01 C/D were determined in this work for 1000-eV to 400-eV deuterium ions incident on a-C:H films. (orig.).

46730 Control of water absorption by purification of graphite. Simpkins, J.E. (Oak Ridge National Lab., TN (USA)); Strehlow, R.A.; Mioduszewski, P.K.; Uckan, T. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 162-164: 164 (Apr 1989). DOE Contract AC05-84OR21400. (CONF-8805285--: 8. international conference on plasma surface interactions in controlled fusion devices (PSI-8), 2-6 May 1988).

It is well known that graphite can absorb large quantities of water, which can represent an abundant source of oxygen impurities in fusion plasmas if the corresponding components are not properly outgassed. We have outgassed various fusion-relevant graphites (e.g., POCO AXF-5Q) for 1.5 h at 1500^{0}C to release absorbed water and have subsequently exposed the samples to air for various periods of time. Re-absorption of water during the air exposure was estimated by measuring the amount of water produced in subsequent outgassing runs. The results show that the amount of water re-absorbed increases by a factor of approximately 10 within 8 h compared to the sample in the outgassed state but with no air exposure. The water content of the "as received" material is reached after approximately 30 days. Re-absorption of water was significantly reduced by purification of the investigated graphite samples. This purification process, which consists of heating the sample at 2800^{0}C for 30 min in an argon atmosphere, reduces the levels of trace impurities which can be responsible for catalytic surface reactions on the internal surfaces of the graphicte. After exposing an outgassed sample to an electron cyclotron heated plasma followed by 1 h air exposure, the amount of water desorbed was observed to increase by a factor of 6. Data will be presented to correlate this effect with trace impurities. (orig.).

46731 Fusion tritium program in the United States. Anderson, J.L. (Los Alamos National Lab., NM (USA). Materials Science and Technology Div.); Bartlit, J.R. *Fusion Technology (USA),* 14(2): 407-411 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

The fusion technology development program for tritium in the U.S is centered around the Tritium Systems Test Assembly (TSTA) at Los Alamos National Laboratory. Objectives of this project are to develop and demonstrate the fuel cycle for processing the reactor exhaust gas (unburned deuterium and tritium plus impurities), and the necessary personnel and environmental protection systems for the next generation of fusion devices. The TSTA is a full-scale system for a machine the size of the International Tokamak Reactor (INTOR) or the International Thermonuclear Experimental Reactor (ITER). That is, TSTA has the capacity to process tritium in a closed loop mode at the rate of 1 kg per day, requiring a tritium inventory of about 100 g. The TSTA program also interacts with all other tritium-related fusion technology programs in the U.S. and all major programs abroad. This report is a summary of the results and interactions of the TSTA program since a previous summary was published and an overview of related tritium programs.

46732 Remotely replaceable Tokamak plasma limiter tiles. Remy, G. To Dept. of Energy, Washington, DC. USA Patent 4,816,205. 28 Mar 1989. Filed date 9 Dec 1987. vp. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

U-shaped limiter tiles placed end-to-end over a pair of parallel runners secured to a wall have two rods which engage L-shaped slots in the runners. The short receiving legs of the L-shaped slots are perpendicular to the wall and open away from the wall, while long retaining legs are parallel to and adjacent the wall. A sliding bar between the runners has grooves with clips to retain the rods pressed into receiving legs of the L-shaped slots in the runners. Sliding the bar in the direction of retaining legs of the L-shaped slots latches the tiles in place over the runners. Resilient contact strips between the parallel arms of the U-shaped tiles and the wall assure thermal and electrical contact with the wall.

46733 Current-level triggered plasma-opening switch. Mendel, C.W. To Dept. of Energy, Washington, DC. USA Patent 4,812,715. 14 Mar 1989. Filed date 29 Jun 1987. vp. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

An opening switch for very high power electrical pulses uses a slow magnetic field to confine a plasma across a gap between two electrodes. The plasma conducts the electrical pulse across the gap while the switch is closed. A magnetic field generated by the pulse repels the slow magnetic field from the negative electrode to push the plasma from the electrode, opening the switch. A plurality of radial vanes may be used to enhance the slow magnetic field.

46734 Cr^{3+}-doped colquirlite solid state laser material. Payne, S.A.; Chase, L.L.; Newkirk, H.W.; Krupke, W.F. To Dept. of Energy, Washington, DC. USA Patent 4,811,349. 7 Mar 1989. Filed date 31 Mar 1988. vp. Available from Patent and Trademark Office, Box 9, Washington, DC 20232.

Chromium doped colquiriite, $LiCaAlF_6:Cr^{3+}$, is useful as a tunable laser crystal that has a high intrinsic slope efficiency, comparable to or exceeding that of alexandrite, the current leading performer of vibronic sideband Cr^{3+} lasers. The laser output is tunable from at least 720 nm to 840 nm with a measured slope efficiency of about 60% in a Kr laser pumped laser configuration. The intrinsic slope efficiency (in the limit of large output coupling) may approach the quantum defect limited value of 83%. The high-slope efficiency implies that excited state absorption (ESA) is negligible. The potential for efficiency and the tuning range of this material satisfy the requirements for a pump laser for a high density storage medium incorporating Nd^{3+} or Tm^{3+} for use in a multimegajoule single shot fusion research facility.

46735 (DOE/FE--0130) **Liquefied Gaseous Fuels Spill Test Facility.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (USA). [1989]. 7p. Sponsored by U.S. DOE Fossil Energy. Order Number DE89015574/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The US Department of Energy's Liquefied Gaseous Fuels Spill Test Facility is a research and demonstration facility available on a user-fee basis to private and public sector test sponsors concerned with safety aspects of hazardous chemicals. Though initially designed to accommodate large liquefied natural gas releases, the Spill Test Facility (STF) accommodates safety-related testing of most chemicals in commercial use. The Facility is located at DOE's Nevada Test Site near Mercury, Nevada, USA. The Spill Test Facility is the only facility of its kind for either large- or small-scale testing of hazardous and toxic fluids with the added capability of large-scale wind tunnel testing under controlled conditions. It is ideally suited for users to develop verified data on prevention, mitigation, clean-up, and environmental effects of toxic and hazardous gaseous liquids. This document is designed to briefly acquaint a potential user of the Spill Test Facility with an outline of the procedures and policies associated with the use of the facility.

46736 (DOE/MA/00356–H4) **1989 National Compensation Survey of Research and Development Scientists and Engineers: Final report: Data effective date: January 15, 1989.** Hay Group, Washington, DC (USA). May 1989. 424p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC01-86MA00356. Order Number DE89015175/JAW. Available from NTIS, PC A18/MF A01 - OSTI; GPO Dep.

This report presents the results of the third in a new series of surveys of compensation and benefits for research and development (R&D) scientists and engineers (S&Es). The 1989 Survey represents the largest nationwide database of its kind, covering 102 establishments which provided data on almost 36,000 degreed researchers in the "hard" sciences.

46737 (SAND–89-1492) **Equation typing: Guidelines for Mass-11 users and others.** Jackson, C.L. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 73p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89015165/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

A number of problems have been experienced by Sandia secretaries and others in the preparation of equations. This report is a self- paced/"how-to" manual designed to provide detailed explanations on the preparation of equations using Mass-11 and the typewriter and is suitable for either classroom training or on-the-job use.

46738 (AECL–9263) **Progress report - Physics and Health Sciences - Health Sciences Section - 1986 January 01 - June 30.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Aug 1986. 118p. (PR-PHS-HS–1). Order Number DE89635689/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

This progress report contains a summary of major research in the Health Sciences Division. Separate chapters are included for each of the following branches: Dosimetric Research, Environmental Research, Radiation Biology, and Medical Biophysics. Some of the aspects discussed include measurement and application of environmental isotopes (e.g., Strontium 85, Strontium 90, Tritium), environmental processes of radioisotope transport (e.g. ground water) dosimetry and employee monitoring, the effects of ionizing radiation on living cells (cancer, hyperthermia, DNA, etc.).

46739 (LA-UR–89-2027) **Difficulties implementing a quality assurance program at a national laboratory.** Bussolini, P.L. Los Alamos National Lab., NM (USA). 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8909110–3: 16. annual conference of the American Society for Quality Control, 17-20 Sep 1989). Order Number DE89014315/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Personnel who perform scientific research are highly educated, highly motivated professionals who are often leaders in their fields. A recent survey of researchers at Los Alamos shows that they like freedom and peer recognition, and dislike red tape. Rigid, prescriptive quality assurance programs are often fail because they are perceived to limit freedom and peer recognition and enhance red tape. This paper will present some of the reasons for research personnel to have rebelled against quality assurance programs and will offer suggestions for the development of a meaningful and successful quality program.

46740 (NUREG–0325-Rev.12) **U.S. Nuclear Regulatory Commission functional organization charts.** Nuclear Regulatory Commission, Washington, DC (USA). Office of Personnel. 1 Jul 1989. 63p. Sponsored by Nuclear Regulatory Commission. Available from NTIS, PC A04/MF A01 - GPO - OSTI.

Functional organization charts for the US Nuclear Regulatory Commission offices, divisions and branches are presented.

46741 (AD-A–207792/3/XAB) **Model of parallel performance. Final report, July-December 1988.** Carmona, E.A.; Rice, M.D. Air Force Weapons Lab., Kirtland AFB, NM (USA). Apr 1989. 50p. (AFWL-TR–89-01). Available from NTIS, PC A03/MF A01.

This report introduces a general model of parallel performance. With the goal of developing conceptual and empirical methods for characterizing and understanding parallel algorithms, new definitions of speedup and efficiency were formulated. These definitions take into account the effects that problem size and the number of processors have on efficiency and speedup, and provide a natural and quantifiable measure of parallel performance. The terms introduced in the definitions provide new and improved interpretations of the 'serial' and 'parallel' fraction parameters commonly used in the literature (i.e., Amdahl's Law) to explain the behavior of parallel algorithms. The model provides a more complete characterization of parallel algorithm behavior and is used to correct apparent deficiencies in the formulation of speedup as expressed by Amdahl's Law. Chapter 2 of this report reviews the basic definitions of speedup and efficiency and introduces new definitions of these quantities in terms of work units and presents two illustrative examples. Chapter 3 discusses two models of parallel performance that appear in the parallel computing literature. The two formulations of speedup and efficiency are based on the notion of 'serial' and 'parallel' fractions and present an apparent dichotomy that must be resolved. Then, the 'serial' and 'parallel' fractions are expressed in terms of the new work quantities introduced in Chapter 2, providing a natural interpretation of the serial and parallel fractions of a task. The resulting equations are used to reconcile the (apparent) dichotomy between Amdahl's Law and the more recent formulation of speedup.

46742 (AD-A–207802/0/XAB) **Information requirements and the implications for parallel computation. Doctoral thesis.** Worley, P.H. Stanford Univ., CA (USA). Dept. of Computer Science. Jun 1988. 149p. (STAN-CS–88-1212). Available from NTIS, PC A07/MF A01.

Sponsored in part by Contract N00014-75-C-1132 and Grant DE-AC05-84OR21400.

The best serial algorithms for numerically approximating the solution of a linear partial differential equation (PDE) exploit knowledge of the solution operator. This dissertation describes how the solution operator also influences the behavior of parallel algorithms. Approximating the solution at a single location in the problem domain is considered. A lower bound on the error in the approximation is derived that is a function of the amount of data used and the smoothness of the data functions. From this one can derive a lower bound on the parallel complexity of algorithms that approximate the solution. The lower bound is a linear function of log 1/epsilon, where epsilon is an upper bound on the error. Thus the parallel complexity increases as epsilon decreases, independent of the number of processors used. An algorithm is also constructed whose parallel complexity is of this form, proving that the form of the bound is the best possible. The execution time of parallel algorithms is a function of both the communication costs and the parallel complexity. We describe bounds on the communication cost of parallel algorithms that are functions of the distance between collaborating processors. If the interconnection network of a multiprocessor is a D dimensional grid, then we prove that the execution time of algorithms that approximate the solution is bounded from below by a linear function of epsilon exp(-gamma/(d + 1)), where gamma is a positive constant determined by the smoothness of the data functions. Thus, for small epsilon, the communication costs are the dominant constraints on the optimal performance.

46743 (AD-A–207807/9/XAB) **Intelligent mathematical modeling system - MATHMODEL. Final report, 1 August 1988-31**

March 1989. Lock, X.G.; Prywes, N. Computer Command and Control Co., Philadelphia, PA (USA). 31 Mar 1989. 69p. Available from NTIS, PC A04/MF A01.

A system, called MATHMODEL was developed by Lock in his research at the University of Pennsylvania. It is a very complex and large multi-phase system. It consists of 142 modules and 60,000 lines of PL/1 code. MATHMODEL is based on an old (1984) version of MODEL system, which automatically translates equational specifications into highly efficient programs in PL/1. Computer Command and Control Company (CCCC) has a much more advanced and reliable version of MODEL that generates programs in several languages (PL/1, C and Ada) and that runs on several computers (IBM and Digital). It also generates programs that can be executed in parallel on distributed computers. Most important, CCCC's MODEL contains many more operations useful in mathematical modeling (e.g. matrix algebra, relational algebra, etc.) This version is much more reliable and robust and is well documented. The project has merged MATHMODEL's capabilities with those of CCCC's MODEL and has transformed MATHMODEL into a greatly more effective tool for mathematical modeling than any system developed to date.

46744 (AD-A-207814/5/XAB) **Radon transform analysis of a probabilistic method for image generation. Annual report No. 2, 1 April 1988-31 March 1989.** Berger, M.A. Carnegie-Mellon Univ., Pittsburgh, PA (USA). 12 Apr 1989. 20p. Available from NTIS, PC A03/MF A01.

The research performed for this grant over the past year involved affine iterated function system (IFS) encoding and IFS mixing for digital images. This relates to a technique of Michael Barnsley's for generating fractal and other images by randomly iterating affine transformations of the plane into itself. By this technique an image is both generated and represented as the long-term probability distribution for a 2-D or 3-D Markov chain. The encoding involves finding an affine 'collage' of the image, whereby it is identified as a convex combination of affinely scaled versions of itself. This permits some remarkable data compression. The mixing involves a merging of IFS's so as to produce images with combined textures. It ties in with the encoding in that a broader class of images can then be efficiently encoded, and there are more degrees of freedom in the encoding search. The mathematical methods used involve stochastic optimization, computational geometry, the Radon transform, dynamical systems and ergodic theory for Markov chains.

46745 (AD-A-207820/2/XAB) **Analysis of cache invalidation patterns in multiprocessors.** Weber, W.D.; Gupta, A. Stanford Univ., CA (USA). Computer Systems Lab. 1989. 20p. Available from NTIS, PC A03/MF A01.

To make shared-memory multiprocessors scalable, researchers are now exploring cache coherence protocols that do not rely on broadcast, but instead send invalidation messages to individual caches that contain stale data. The feasibility of such directory-based protocols is highly sensitive to the cache invalidation patterns that parallel programs exhibit. This paper analyzes the cache invalidation patterns caused by several parallel applications and investigate the effect of these patterns on a directory-based protocol. Results are based on multiprocessor traces with 4, 8 and 16 processors. To get insight into what the invalidation patterns would look like beyond 16 processors, a classification scheme is proposed for data objects found in parallel applications and link the invalidation traffic patterns observed in the traces back to these high-level objects. Results show that synchronization objects have very different invalidation patterns from those of other data objects. A write reference to a synchronization object usually causes invalidations in many more caches. Situations are noted where restructuring the application seems appropriate to reduce the invalidation traffic, and others where hardware support is more appropriate. Results also show that it should be possible to scale 'well-written' parallel programs to a large number of processors without an explosion in invalidation traffic.

46746 (AD-A-207827/7/XAB) **Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements. Annual report, 1 January-31 December 1988.** Schafer, R.W.; Paris, D.T. Georgia Inst. of Tech., Atlanta, GA (USA). School of Electrical Engineering. 1 Jan 1989. 44p. Available from NTIS, PC A03/MF A01.

This is an annual report on research conducted under the auspices of the Joint Services Electronics Program. Specific topics covered are: digital signal processing, parallel processing architectures, two-dimensional optical storage and processing, hybrid optical/digital signal processing, electromagnetic measurements in the time domain, and automatic radiation measurements for near-field and far-field transformation.

46747 (AD-A-207842/6/XAB) **Characterization of parallelism and deadlocks in distributed digital logic simulation. Draft report.** Soule, L.; Gupta, A. Stanford Univ., CA (USA). Computer Systems Lab. 3 Nov 1988. 15p. Available from NTIS, PC A03/MF A01.

This paper explores the suitability of the Chandy-Misra algorithm for digital logic simulation. Four realistic circuits are used as benchmarks for the analysis, with one of them being the vector-unit controller for the Titan supercomputer from Ardent. The results show that the average number of logic elements available for concurrent execution ranges from 6.2 to 92 for the four circuits, with an overall average of 50. Although this is twice as much parallelism as that obtained by traditional event-driven algorithms, it is still felt too low. One major factor limiting concurrency is the large number of global synchronization points - deadlocks in the Chandy-Misra terminology - that occur during execution. Towards the goal of reducing the number of deadlocks, the paper presents a classification of the types of deadlocks that occur during digital logic simulation. Four different types are identified and described both intuitively in terms of circuit structure and formally with equations. Using domain specific knowledge, the paper proposes methods for reducing these deadlock occurrences. For one of the benchmark circuits, the use of the proposed techniques eliminated all deadlocks and increased the average parallelism from 40 to 160. We believe that the use of such domain knowledge will make the Chandy-Misra algorithm significantly more effective than it would be in its generic form. (jhd)

46748 (CONF-881054--Vol.1, pp. 33-44) **Compliance program data management system for the Idaho National Engineering Laboratory/Environmental Protection Agency.** Hertzler, C.L. (EG and G Idaho, Inc., Idaho Falls (USA)); Poloski, J.P.; Bates, R.A.; Van Haaften, D.H.; Shea, J.P.; Fritz, L.L. Analysas Corp., Oak Ridge, TN (USA). 1988. DOE Contract AC07-76ID01570. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 1.* Order Number DE89014700/JAW. Available from NTIS, PC A15/MF A01.

The Compliance Program Data Management System (DMS) developed at the Idaho National Engineering Laboratory (INEL) validates and maintains the integrity of data collected to support the Consent Order and Compliance Agreement (COCA) between the INEL and the Environmental Protection Agency (EPA). The system uses dBase III Plus programs and dBase III Plus in an interactive mode to enter, store, validate, manage, and retrieve analytical information provided on EPA Contract Laboratory Program (CLP) forms and CLP forms modified to accommodate 40 CFR 264 Appendix IX constituent analyses. Data analysis and presentation is performed utilizing SAS, a statistical analysis software program. Archiving of data and results is performed at appropriate stages of data management. The DMS is useful for sampling and analysis programs where adherence to EPA CLP protocol, along with maintenance and retrieval of waste site investigation sampling results is desired or requested.

46749 (CONF-881054--Vol.1, pp. 45-54) **Using online information for hazard assessment.** Reed, K.L. (Oak Ridge Associated Universities, TN (USA)); Carroll, E.W. Analysas Corp., Oak Ridge, TN (USA). 1988. DOE Contract AC05-76OR00033. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 1.* Order Number DE89014700/JAW. Available from NTIS, PC A15/MF A01.

Increasingly more databases are available online to assist in the process of hazard assessment as required by CERCLA, SARA, RCRA, and similar legislation. This paper discusses the utility of data files available through the National Library of Medicine (NLM) for completing health assessment and the role of training in making more effective use of such systems. The authors discuss (1) how online information can be used to complete hazard assessments, (2) how training can be developed to support effective use of online

files, and (3) the importance of user support systems in connecting database users with the information they need. The discussion draws on knowledge and experience gained in developing training systems for the US Department of Energy, Department of Energy contractors, the National Library of Medicine, the Agency for Toxic Substances and Disease Registry, and state public health officials.

46750 (CONF-881054–Vol.1, pp. 65-77) **Evaluating historical environmental data.** Price, J.B. (Roy F. Weston, Inc., Albuquerque, NM (USA)); Wood, C.J. Analysas Corp., Oak Ridge, TN (USA). 1988. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 1.* Order Number DE89014700/JAW. Available from NTIS, PC A15/MF A01.

When conducting most remedial investigation/feasibility studies (RI/FS), there usually exists some previously collected data. These data have potential for use in the RI/FS if these data can be systematically reviewed and assigned a level of acceptability based on their intended use. The usefulness and utilization of these existing data requires a determination of there relevancy, validity, sufficiency, and, integrity. This determination is accomplished through a process called data acceptance. The objective of this process is to evaluate compliance to US DOE and EPA guidance on Quality Assurance/Quality Control (QA/QC). This process supports a realization of cost-effectiveness which implies that historical data must be discarded only with cause, while the realization of quality assurance directs that this data be accepted only with cause. To evaluate this previously collected data in a cost-effective manner, the data are organized in a hierarchical manner, according to the dependences of the data. This allows the discarding of some dependent data without an extensive and costly review, based on the discarding of the data that they depend on. Several criteria may be used to judge the acceptability of data. These include sufficiency of data reporting, the presence and sufficient documentation of QA/QC, the documentation of custody, and the validity of sampling and analysis methodology. In summary, historical environmental data can be used in the RI/FS decision making and engineering if a determination of the data quality can be established.

46751 (CONF-881054–Vol.1, pp. 79-90) **Systems analysis support to the waste management technology center.** Rivera, A.L.; Osborne-Lee, I.W.; DePaoli, S.M. Analysas Corp., Oak Ridge, TN (USA). 1988. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 1.* Order Number DE89014700/JAW. Available from NTIS, PC A15/MF A01.

This paper describes a systems analysis concept being developed in support of waste management planning and analysis activities for Martin Marietta Energy Systems, Inc. (Energy Systems), sites. This integrated systems model serves as a focus for the accumulation and documentation of technical and economic information from current waste management practices, improved operations projects, remedial actions, and new system development activities. The approach is generic and could be applied to a larger group of sites. This integrated model is a source of technical support to waste management groups in the Energy Systems complex for integrated waste management planning and related technology assessment activities. This problem-solving methodology for low-level waste (LLW) management is being developed through the Waste Management Technology Center (WMTC) for the Low-Level Waste Disposal, Development, and Demonstration (LLWDDD) Program. In support of long-range planning activities, this capability will include the development of management support tools such as specialized systems models, data bases, and information systems. These management support tools will provide continuing support in the identification and definition of technical and economic uncertainties to be addressed by technology demonstration programs. Technical planning activities and current efforts in the development of this system analysis capability for the LLWDDD Program are presented in this paper.

46752 (CONF-881054–Vol.1, pp. 355-366) **Groundwater extraction and disposal program to control off-site migration of soluble petroleum hydrocarbons.** Hall, P.J. (E. C. Jordan Co. (USA)). Analysas Corp., Oak Ridge, TN (USA). 1988. From 4. annual DOE model conference; 3-7 Oct 1988. In *1988 DOE model conference proceedings. Volume 1.* Order Number DE89014700/JAW. Available from NTIS, PC A15/MF A01.

Petroleum contamination has occurred at a fuel storage facility in New Jersey resulting in both floating fuel product and dissolved benzene, toluene, and xylene (BTX) chemicals in groundwater. Based on the distribution and concentrations of the BTX chemical plume, a remedial action program was developed to control off-site migration of chemicals. The site itself overlies a shallow sand and gravel aquifer which has slight downward vertical gradients and horizontal flow rates estimated at 6 to 10 feet per year. Current analytical data show the dissolved plume to be generally narrow in width and migrating in the same direction as groundwater flow. A multi-well groundwater extraction system was designed to capture dissolved petroleum hydrocarbons while creating a minimal hydrologic impact to free-product located near the contaminant source. A separate hydrocarbon recovery system will be utilized to remove the floating fuel product. As part of this program, several disposal options were evaluated to discharge effluent from an activated carbon filter treatment process. These alternatives included an off-site leachfield, discharge to a publicly owned treatment facility (POTW), and a leachfield located at the site. The development of the extraction system was completed using both analytical and numerical groundwater flow models. The feasibility of the disposal alternatives was verified through additional modeling and an evaluation of permit requirements.

46753 (CONF-890814–6) **Systems analysis considerations in artificial intelligence/expert systems technology applications.** Rivera, A.L. Oak Ridge National Lab., TN (USA). [1989]. 12p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. From American Institute of Chemical Engineer's summer national meeting; 20-23 Aug 1989. Order Number DE89016847/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The concept of artificial intelligence (AI) represents a challenging opportunity in expanding the potential benefits from computer systems. The potential of this concept lies in facilitating the development of intelligent computer systems to help analysts and decision-makers in problem solving in the same way that machines support the laborer. Because the knowledge of human experts is an essential input to many parts of chemical process planning, development, and operation, there are numerous opportunities for the applications of expert systems (a product from AI) in chemical engineering. Intelligent computer systems could be developed by chemical engineers to increase the contribution of computer technology to the advancement of the profession, particularly in the strategic management of the scientific and technological aspects of chemical engineering applications. This paper introduces systems analysis as a framework for the planning and development of intelligent computer systems in those areas where chemical engineering could play a significant role. 11 refs., 9 figs.

46754 (CONF-8905198–1) **An example of a reaction-diffusion system with nonlinear competitive interactions.** Protopopescu, V. Oak Ridge National Lab., TN (USA). [1989]. 12p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. From 11. international conference on transport theory; 22-26 May 1989. Order Number DE89016223/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

An example of a parabolic system with nonlinear local or nonlocal interactions is considered with specific applications to the description of competition situations. Under suitable assumptions on the interaction terms, one can derive global existence as well as a comparison result between the PDE solutions and the "lumped" (space-integrated) ODE solutions. The uniqueness issue for the stationary state of the system – corresponding to a stalemate – is also considered. The discrete version of the system is then constructed and some preliminary results for the two-species one-index map and for the one-species two-index map are discussed. 10 refs.

46755 (CONF-8908121–1) **Electronic Forms-EARS [Electronic Authorization and Routing System] Beta Test Pilot Project: Final report.** Smith, P.T. Oak Ridge National Lab., TN (USA). Aug 1989. 29p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From Electronic Authorization and Routing System EARS meeting; 7 Aug 1989. Order Number DE89016078/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Electronic Forms-EARS Beta Test Pilot Project is a Martin Marietta Energy Systems' project designed to accomplish the combined goals of beta testing the Electronic Authorization and Routing System (EARS) software and testing the routing of Energy Systems designed forms using the EARS software. The Electronic Authorization and Routing System (EARS) is a joint project of DOE/ALO, Sandia National Laboratory at Albuquerque (SNLA), Savannah River Plant, and Digital Equipment Corporation (DEC). The purpose of the system is to provide a controlled, automated system for documents which may require signatory approvals through a routine or designated ad hoc chain of reviewers. Alpha testing was completed at SNLA during the fall of 1988 and beta testing was begun at selected DOE sites during the spring of 1989.

46756 (CONF-8909127–1) **An integrated diagnostic system for a process controller.** Mullens, J.A.; Williams, L.C.; Zabriskie, W.L. Oak Ridge National Lab., TN (USA). 1989. 6p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. From 1. international machinery monitoring and diagnostic conference; 11-14 Sep 1989. Order Number DE89012509/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Oak Ridge National Laboratory Instrumentation and Controls Division is developing an integrated diagnostic system to aid a technician in diagnosing faults in a complex process controller. The integrated diagnostic system, which is being developed to run on 80386 machines in the Smalltalk language, will include an expert system to make a diagnosis, an on-line "hypermedia" manual (which includes equipment manuals and video) to supply additional help and reference material, and an automated procedure guide to take the technician through complex procedures for tasks such as parts replacement. 3 refs., 6 figs.

46757 (DOE/ER/25009–806) **Applications of parallel supercomputers: Scientific results and computer science lessons.** Fox, G.C. California Inst. of Tech., Pasadena, CA (USA). 12 Jul 1989. 92p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-85ER25009. (CONF-8903158–1: Inaugural symposium for Center for Science and Technology, 2 Mar 1989). Order Number DE89016385/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

Parallel Computing has come of age with several commercial and inhouse systems that deliver supercomputer performance. We illustrate this with several major computations completed or underway at Caltech on hypercubes, transputer arrays and the SIMD Connection Machine CM-2 and AMT DAP. Applications covered are lattice gauge theory, computational fluid dynamics, subatomic string dynamics, statistical and condensed matter physics,theoretical and experimental astronomy, quantum chemistry, plasma physics, grain dynamics, computer chess, graphics ray tracing, and Kalman filters. We use these applications to compare the performance of several advanced architecture computers including the conventional CRAY and ETA-10 supercomputers. We describe which problems are suitable for which computers in the terms of a matching between problem and computer architecture. This is part of a set of lessons we draw for hardware, software, and performance. We speculate on the emergence of new academic disciplines motivated by the growing importance of computers. 138 refs., 23 figs., 10 tabs.

46758 (EPRI-NP–6507) **Application of modern computer technology to EPRI [Electric Power Research Institute] nuclear computer programs: Final report.** Feinauer, L.R. Electric Power Research Inst., Palo Alto, CA (USA); Power Computing, Dallas, TX (USA). c Aug 1989. 102p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

Many of the nuclear analysis programs in use today were designed and developed well over a decade ago. Within this time frame, tremendous changes in hardware and software technologies have made it necessary to revise and/or restructure most of the analysis programs to take advantage of these changes. As computer programs mature from the development phase to being production programs, program maintenance and portability become very important issues. The maintenance costs associated with a particular computer program can generally be expected to exceed the total development costs by as much as a factor of two. Many of the problems associated with high maintenance costs can be traced back to either poorly designed coding structure, or "quick fix" modifications which do not preserve the original coding structure. The lack of standardization between hardware designs presents an obstacle to the software designer in providing 100% portable coding; however, conformance to certain guidelines can ensure portability between a wide variety of machines and operating systems. This report presents guidelines for upgrading EPRI nuclear computer programs to conform to current programming standards while maintaining flexibility for accommodating future hardware and software design trends. Guidelines for development of new computer programs are also presented. 22 refs., 10 figs.

46759 (JAERI-M–89-012) **Proceedings of the fifth seminar on software development in nuclear energy research.** Hasegawa, Akira; Maekawa, Hiroshi; Fujiki, Kazuo; Harada, Hiroo (eds.) (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1989. 205p. (In Japanese). (CONF-8810416–: 5. seminar on software development in nuclear energy research, 17-18 Oct 1988). Order Number DE89906455/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

These proceedings are the compilations of papers presented to the Fifth Seminar on Software Development in Nuclear Energy Research held at Tokai Research Establishment, Japan Atomic Energy Research Institute (JAERI), October 17 - 18, 1988. The seminar was organized in cooperation with Japanese Committee on Reactor Physics (JCRP) and Japanese Nuclear Code Committee (JNCC). The topics of seminar include the invited papers on the subjects: - Net work for Atomic Energy Research - (1) Present and future of Networks, (2) Applications of Networks, (3) Panel Discussion : Usage of Networks in Atomic Energy Research, - Frontier of Simulation Softwares for the Environment Safety - (4) Numerical Simulation of Global Scale Dispersion on the Chernobyl Accident, and (5) Oceanic Diffusion and Safety Evaluation of High Level Waste Disposal in Geological Media. (author).

46760 (LA-UR–89-2706) **An integrated distributed processing interface for supercomputers and workstations.** Campbell, J.; McGavran, L. Los Alamos National Lab., NM (USA). [1989]. 9p. Sponsored by U.S. DOE Management & Administration. DOE Contract W-7405-ENG-36. (CONF-890941–2: Conference on applications of supercomputers in engineering, 5-7 Sep 1989). Order Number DE89016769/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Access to documentation, communication between multiple processes running on heterogeneous computers, and animation of simulations of engineering problems are typically weak in most supercomputer environments. This presentation will describe how we are improving this situation in the Computer Research and Applications group at Los Alamos National Laboratory. We have developed a tool using UNIX filters and a SunView interface that allows users simple access to documentation via mouse driven menus. We have also developed a distributed application that integrated a two point boundary value problem on one of our Cray Supercomputers. It is controlled and displayed graphically by a window interface running on a workstation screen. Our motivation for this research has been to improve the usual typewriter/static interface using language independent controls to show capabilities of the workstation/supercomputer combination. 8 refs.

46761 (LBL–26601) **Effective resource utilization for multiprocessor join execution.** Murphy, M.C.; Rotem, D. Lawrence Berkeley Lab., CA (USA). Jan 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8908116–1: 15. international conference on very large data bases, 22-25 Aug 1989). Order Number DE89016303/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Conventional approaches to execution of database queries on general purpose multiprocessors attempt to maximize system throughput using inter-query parallelism with a fixed number of processors. Standard uniprocessor optimization techniques are used to minimize execution time of individual queries. Our approach is to increase performance by utilizing intra-query parallelism as well as minimizing overall resource requirements. Specifically, processor and i/o bandwidth requirements are minimized by coordinating the

order in which data pages are read into memory and page joins assigned to available processors. We present a scheduling strategy based on join indices and prove lower and upper bounds on its resource requirements. We then describe a heuristic for estimating the number of processors required to complete join execution in minimal time. Our simulation results indicate that these techniques are effective with respect to processor utilization and buffer requirements. 11 refs.

46762 (N–89-23184) **Parallel processors and nonlinear structural dynamics algorithms and software. Semiannual progress report, 1 March-31 August 1988.** Belytschko, T. Northwestern Univ., Evanston, IL (USA). Apr 1989. 36p. (NASA-CR–184938;NAS–1.26:184938). Available from NTIS, PC A03/MF A01.

A nonlinear structural dynamics finite element program was developed to run on a shared memory multiprocessor with pipeline processors. The program, WHAMS, was used as a framework for this work. The program employs explicit time integration and has the capability to handle both the nonlinear material behavior and large displacement response of 3-D structures. The elasto-plastic material model uses an isotropic strain hardening law which is input as a piecewise linear function. Geometric nonlinearities are handled by a corotational formulation in which a coordinate system is embedded at the integration point of each element. Currently, the program has an element library consisting of a beam element based on Euler-Bernoulli theory and trianglar and quadrilateral plate element based on Mindlin theory.

46763 (PB–89-185367/XAB) **MSP modelling of concurrent processes. Version 1.00. General introduction and directions for use.** Mebius, J.E. Technische Hogeschool Delft (Netherlands). Dept. of Mathematics and Informatics Computer Science. 1988. 24p. (REPT–88-88). Available from NTIS, PC EE03/MF A01.

MSP is an interactive system for running models of systems of concurrent processes (henceforth often called concurrent systems). MSP runs a concurrent system according to the single-processor model with interleaving of process steps as permitted by the concurrent system's process texts. For each concurrent system to be run under MSP, a so-called model is created. The model takes the form of a ready-to-run Turbo-PASCAL program which consists of a general framework, common to all models, and a specific part, which consists essentially of the process texts of the concurrent system in question. The next paragraph explains how processes are represented in MSP. The framework may be conceived as a rudimentary operating system, whereas the process texts may be thought of as representing tasks to be run by that operating system. A difference from real-life operating systems is of course that in a MSP model the OS and the tasks are integrated into a fixed whole.

46764 (PNL-SA–17221) **Principal components in multivariate control charts.** Eggett, D.L.; Pulsipher, B.A. Pacific Northwest Lab., Richland, WA (USA). Aug 1989. 22p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC06-76RL01830. (CONF-8908108–2: American Statistical Association meeting, 9 Aug 1989). Order Number DE89016828/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Principal components have been used as a variable reduction technique. The principal component scores have desirable statistical properties when the original variables are distributed as multivariate normal. In this paper, three statistics derived from the PC scores and used to form multivariate control charts are examined. These statistics are outlined and their distributional properties reviewed. The effectiveness of control charts using the three statistics was examined through Monte Carlo simulations. Several parameters were varied including correlation pattern, size of changes in means and variances, number of means or variances changed, change in the correlation for one variable, and the number of PCs retained. 3 refs., 9 tabs.

46765 (SAND–88-2896) **Evaluation of integrals related to the Debye function.** Amos, D.E. Sandia National Labs., Albuquerque, NM (USA). Jul 1989. 8p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89016930/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Certain models for the penetration and perforation of metal plate targets impacted by high velocity projectiles lead to integrals related to the Debye function. These integrals are numerically evaluated by a combination of series expansions near singularities and numerical quadrature away from singularities. Numerical evaluation of the Riemann zeta function and dilogarithm function for small parameters are by-products of this analysis. 5 refs., 1 fig.

46766 (SAND–89-0220C) **Optical coherence multiplexing for interprocessor communications.** Chu, K.W.; Dickey, F.M. Sandia National Labs., Albuquerque, NM (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909177–1: Optical engineering/fibers '89 meeting, 5-8 Sep 1989). Order Number DE89016186/JAW. Available from NTIS, PC A03/MF A01; OSTI; INIS; GPO Dep.

The development of an optical circuit that multiplexes gigabit-per-second electronic data streams into a very broad bandwidth (greater than 10 Gbit/s) optical signal would greatly enhance interprocessor communications in a parallel computer. One possibility that we are investigating is coherence multiplexing. In this method, time delays exceeding the coherence time of the light source are used to achieve multiplexing. We have analyzed the limitations of coherence multiplexing for high-speed data links. For the geometry that we are investigating, the analysis shows that the signal decreases inversely as the square of the number of channels. Noise sources include photon shot noise, excess noise (classical optical field fluctuations) and detector noise. A suitable optical source must have a smooth broad spectrum. Superluminescent diodes or edge emitting diodes are the best candidates. We show how all these factors affect the total information transfer rate. An integrated optical circuit for coherence multiplexing is being designed and built. This device is an array of four Mach-Zehnder interferometers integrated on a lithium niobate substrate. The differential delays will be achieved using proton exchange. Each interferometer will have two sets of electrodes, one for signal modulation and a second for fine adjustments of the delay. 31 refs., 9 figs.

46767 (SAND–89-1055) **LEXER: A tool for lexical analysis of program input.** Kephart, E.M.; Selleck, C.B. Sandia National Labs., Albuquerque, NM (USA); RE/SPEC, Inc., Albuquerque, NM (USA). Aug 1989. 28p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (RSI–0327). Order Number DE89016924/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

LEXER is a useful tool for lexical analysis. It is designed to give an application programmer the ability to write code that will quickly parse commands to an interactive program. It is also useful in parsing character data stored in a file. This is done by lexically analyzing the input character string and placing its components and related information into arrays stored in common blocks. The code is written in FORTRAN which conforms to the ANSI Standard FORTRAN 77 in all but a few carefully documented areas. 2 refs.

46768 (SAND–89-1452C) **New supercomputer market segments in manufacturing.** Bray, O.H. Sandia National Labs., Albuquerque, NM (USA). 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909139–1: Meeting on supercomputers: emerging applications in manufacturing, 11-13 Sep 1989). Order Number DE89013070/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The supercomputer industry is at a crossroads. While its traditional markets have become relatively mature, the industry is becoming more competitive, especially with the challenge from Japan. The industry can either fight over this stable market or dramatically expand the market. The choice is obvious, but what are these new markets and how to approach them. This paper addresses these issues. First, it explains how the traditional definition of a supercomputer seriously constrains its market. An alternate definition opens up a much larger, emerging market. Second, it describes a market segmentation two barriers preventing customer in these new segments from using supercomputing and describes mechanisms to reduce and/or eliminate these barriers. Third, it discusses the portfolio analysis strategy to determine the markets in these new segments on which to concentrate. Obviously, parts of manufacturing are key targets. Finally, it draws some conclusions in terms of two scenarios – one which describes a healthy, growing

US supercomputer industry, the alternative showing the industry rapidly following the footsteps of the US consumer electronics industry. 6 refs.

46769 (SAND–89-1542C) **GaAs ASIC design case study.** Heise, J.A. Sandia National Labs., Albuquerque, NM (USA). 1989. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8909146–2: 2. annual IEEE/ASIC seminar and exhibit, 25-28 Sep 1989). Order Number DE89013934/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

With increasing demands on system requirements, designers must look for new alternatives to successfully complete their goals. One alternative that offers designers many benefits is ASICs. They maximize device functionality while minimizing system space. Also as operating frequencies approach gigahertz speeds, ASICs allow specialized placement of functional blocks on chip to minimize propagation delays of the signal. At Sandia, we found these requirements forcing us to look at ASICs fabricated in GaAs.

46770 (UCID–20664-88) **Computer Science Research: Computation Directorate.** Durst, M.J. (ed.); Grupe, K.F. (ed.). Lawrence Livermore National Lab., CA (USA). 1988. 138p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89015618/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

This report contains short papers in the following areas: large-scale scientific computation; parallel computing; general-purpose numerical algorithms; distributed operating systems and networks; knowledge-based systems; and technology information systems.

46771 (UCID–21740) **Programming in C at NMFECC [National Magnetic Fusion Energy Computing Center]: A practical guide.** Haney, S.W.; Crotinger, J.A. Lawrence Livermore National Lab., CA (USA). 26 Jul 1989. 46p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. Order Number DE89015185/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Despite its popularity elsewhere, C has not been extensively used for scientific programming on supercomputers. There are a number of reasons for this but perhaps the most compelling has been the lack of C compilers. However, this situation has recently begun to change at the National Magnetic Fusion Energy Computing Center (NMFECC) where two C development platforms — the Hybrid C Compiler (HCC) written at the Livermore Computer Center and the Portable C Compiler (CC version 4.1) distributed by Cray Research, Inc. (CRI) — have become available for use. These compilers produce object code for all of the Cray models at NMFECC and, in addition, possess good scalar optimization capabilities along with rudimentary vectorization capabilities. With the advent of the Cray C compilers, it is possible to consider physics code development in C at NMFECC. However, when one actually attempts to pursue this goal, one is quickly faced with a number of practical problems. For instance, How do I compile, link, and debug C codes? What special features of C are useful to me as a scientific programmer? Are there things I currently can't do in C programs? How do I interface my C program to existing Fortran code? Can I make use of the Basis code development system from C? Over the last three years we have incorporated C into numerous physics codes written at NMFECC and, in the course of this work, we have had to develop solutions to all of the above problems. This turned out to be a surprisingly frustrating and time-consuming venture requiring some rather subtle techniques and hacks. This guide is an attempt to document these techniques.

46772 (UCRL–53921-th) **An investigation of the usefulness of Earley's Algorithm in a general context-free recognizer.** Benedetti, C.M. Lawrence Livermore National Lab., CA (USA). Jun 1989. 95p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89016498/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

This thesis explores the potential applications of a general context-free recognizer implemented using Earley's Algorithm. First, several potential applications are identified. The recognizer is implemented, and tested using several grammars and input strings representative of these applications. The results of these tests are then examined to determine whether Earley's Algorithm can be successfully used in a general context-free recognizer. 19 refs., 8 figs., 18 tabs.

46773 (UCRL–100283) **Computing the two dimensional fast Fourier transform on a general purpose mesh connected multiprocessor.** Johansson, E.M.; De Groot, A.J.; Parker, S.R. Lawrence Livermore National Lab., CA (USA). 1989. 11p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8908130–1: SPIE conference on real-time signal processing XII, 10-11 Aug 1989). Order Number DE89016515/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper discusses an implementation of the two dimensional fast Fourier transform (FFT) on SPRINT, the Systolic Processor with a Reconfigurable Interconnection Network of Transputers. SPRINT is a 64 element multiprocessor developed at Lawrence Livermore National Laboratory for the experimental evaluation of systolic algorithms and architectures. The implementation is a radix two decimation in time algorithm, valid for an arbitrary sized $p \times q$ mesh of processors and an arbitrary sized $P \times Q$ complex input array (P, Q, p, and q must all be powers of two). The processors are interconnected with their nearest neighbors along North-South-East-West communication links. The problems of array partitioning, bit reversal, sub-array transform computation, and weighed (butterfly) combinations are all discussed. Finally, benchmark results are presented, and speedup and efficiency are discussed. 3 refs., 5 figs.

46774 (UCRL–100958) **Addressing user display requirements from a large and diverse user community.** Hunter, C.L.; Shultz, E.E. Jr. Lawrence Livermore National Lab., CA (USA). 19 Apr 1989. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8909126–1: 3. international conference on human computer interaction, 18-22 Sep 1989). Order Number DE89011403/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper describes a systematic, widely applicable methodology for defining user requirements for system functionality and user interface capabilities. This methodology is a variation of the user centered system design approach, which focuses on the user of a system. Our methodology involves obtaining user input from questionnaires and interviews, utilizing a range of statistical techniques to analyze user data, then developing mathematical models to define user needs. This methodology was used successfully to define user requirements in a replacement for an absolute system at Lawrence Livermore National Laboratory. Advantages and disadvantages of this methodology are discussed. 6 refs., 1 fig., 3 tabs.

46775 (UCRL–101208) **Methods and software for differential-algebraic systems.** Petzold, L.R. Lawrence Livermore National Lab., CA (USA). Jun 1989. 19p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-8908105–1: North Atlantic Treaty Organization advanced research workshop in real-time integration methods for mechanical system simulation, 8-11 Aug 1989). Order Number DE89015118/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In recent years there has been a great deal of progress in the development of numerical methods and software for the solution of initial value problems in differential-algebraic equations (DAE's). In this paper we review the current state of the development and analysis of numerical methods such as multistep and implicit Runge-Kutta applied to classes of DAE's occurring in applications. We describe some of the available software, giving in particular details on the implementation and use of DASSL and its extensions. 37 refs.

46776 (UCRL–101256) **An overview of ASSESS-analytic system and software for evaluating safeguards and security.** Al-Ayat, R.A.; Cousins, T.C.; Matter, J.C. Lawrence Livermore National Lab., CA (USA). 26 Jun 1989. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890736–63: 30. annual meeting of the Institute of Nuclear Materials Management, 9-12 Jul 1989). Order Number DE89016523/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper provides an overview of ASSESS, a comprehensive approach for evaluating the effectiveness of facility safeguards against a spectrum of threats: insiders, outsiders, and hand-off collusion between insider and outsider adversaries. ASSESS version

1.0, completed in March 1989, contains significant new capabilities not present in the models currently used at DOE sites: ET and SAVI. The Insider module uses a reference database of defeat methods, strategies, and detection probabilities to determine the optimal theft scenario and Probability of Detection for each insider adversary type. The Outsider module calculates Probabilities of Interruption and identifies most vulnerable paths for a threat spectrum of: terrorists, criminals, psychotics, and extremists. A Neutralization module calculates the Probability of Neutralization of violent adversaries in a small force engagement for up to 30 combatants per side and 10 events. A Hand-off Collusion module calculates probabilities of System Win against hand-off of theft material by various insiders in collusion with outsiders. This paper describes the scope of, and the relationship between, each of the six modules–Manager, Facility, Insider, Outsider, Neutralization, and Hand-off Collusion-in the integrated ASSESS package developed jointly by Lawrence Livermore National Laboratory and Sandia National Laboratories for the US department of Energy's Office of Safeguards and Security. 11 refs., 9 figs.

46777 (INDC(NDS)–219/LNA) **Report of the Nuclear Data Section to the International Nuclear Data Committee, September 1987 to February 1989.** Lorenz, A. (ed.). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. May 1989. 39p. Order Number DE89636509/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

This progress report of the IAEA Nuclear Data Section covers the 18-months period September 1987 to February 1989. It describes past, current and planned activities of the Section and presents the status of its nuclear data centre services and technology transfer. (author). 2 figs, 2 tabs.

46778 (PNL–6925) **Testing systems database specification.** Caplinger, J.T.; Corrigan, A.L.; Olander, M. Pacific Northwest Lab., Richland, WA (USA). May 1989. 114p. Sponsored by U.S. Department of Defense. DOE Contract AC06-76RL01830. (TD–2699). Order Number DE89016245/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The Pacific Northwest Laboratory (PNL) has been contracted by the Navy Personnel Research and Development Center (NPRDC) to provide software for enhancing the NPRDC CAMP Facility. The objectives of this Database Specification are to provide the Database Administrator, maintenance programmers, and users with the following: a reference to the database design and data tables in the database, a description of the data flow when loaded into the database, a list of storage requirements for the database and support programs, and a discussion of the security issues involved. This paper describes the database: its name, physical system, availability, storage requirements, organization, data loading logic, data modification, support programs, and security. Also defined are the data tables and elements that compose the TSD.

46779 (PNL–6926) **Testing Systems Database Interface operation manual.** Caplinger, J.T.; Olander, M. Pacific Northwest Lab., Richland, WA (USA). May 1989. 77p. Sponsored by U.S. Department of Defense. DOE Contract AC06-76RL01830. (TD–2699). Order Number DE89016243/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

A joint-service effort is under way to develop, evaluate, and field-test a Computerized Adaptive Testing version of the Armed Services Vocational Aptitude Battery (CAT-ASVAB). The CAT-ASVAB is being evaluated as a replacement for the Paper and Pencil ASVAB (P&P-ASVAB), which is currently used for military personnel selection and classification. During the Score Equating Development (SED) phase of the evaluation, the CAT-ASVAB is being administered at a limited number of Military Entrance Processing Stations (MEPS). At these stations all examinees are given an operational P&P-ASVAB; in addition, approximately one-third are given a nonoperational P&P-ASVAB and two-thirds are given the CAT-ASVAB. Data are being transmitted from the MEPS to the Navy Personnel Research and Development Center (NPRDC) for analysis and storage in the Testing Systems Database. The Testing Systems Database (TSD) and its supporting programs reside on a minicomputer at the NPRDC's CAT-ASVAB Maintenance and Psychometric (CAMP) Facility in San Diego, California. The CAMP Facility supports the development, maintenance, and continuing improvement of the CAT-ASVAB testing program. The purpose of this Interface Operation Manual is to provide operating instructions for the TSD "Interface," a system of menus and interactive screen displays that integrate the use of the TSD and its supporting programs. It is not the purpose of this manual to document in detail the general use of commercial or NPRDC-produced programs that are documented elsewhere. 34 figs.

46780 (PNL–6927) **Testing systems database interface users manual.** Olander, M. Pacific Northwest Lab., Richland, WA (USA). May 1989. 29p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. (TD–2699). Order Number DE89016240/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A joint-service effort is under way to develop, evaluate, and field-test a Computerized Adaptive Testing version of the Armed Services Vocational Aptitude Battery (CAT-ASVAB). The CAT-ASVAB is being evaluated as a replacement for the Paper and Pencil ASVAB (P& P-ASVAB), which is currently used for military personnel selection and classification. During the Score Equating Development (SED) phase of the evaluation, the CAT-ASVAB is being administered at a limited number of Military Entrance Processing Stations (MEPS). At these stations all examinees are given a P&P operational ASVAB; in addition, approximately one-third are given a P&P non-operational ASVAB and two-thirds are given the CAT-ASVAB. Data are being transmitted from the MEPS to the CAT-ASVAB Maintenance and Psychometric (CAMP) Facility for analysis and storage. The CAMP Facility supports the development, maintenance, and continuing improvement of the CAT-ASVAB testing program. The Pacific Northwest Laboratory (PNL) was contracted by the Navy Personnel and Development Center (NPRDC) to provide software for enhancing the NPRDC CAMP facility. The objective of this Users Manual is to provide an overview of the Testing Systems Database (TSD) Interface, which is designed to support the transfer, quality assurance, analysis, and maintenance of data pertaining to the evaluation of the CAT-ASVAB. This document provides the general management and personnel who are not automated data processing staff with the information necessary to understand the system.

46781 (SAND–89-1502) **Performance reports for EIM [Engineering Information Management] computer systems: A managerial perspective.** Wenderlich, N.D.; Reid, R.A. Sandia National Labs., Albuquerque, NM (USA). Jul 1989. 36p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC04-76DP00789. Order Number DE89015194/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This document describes twelve different kinds of charts which have been designed to help manage the performance of the Engineering Information Management (EIM) computer systems at Sandia National Laboratories Albuquerque. Operational data generated by the two major software systems, Multiple Virtual Storage (MVS) and Integrated Database Management System (IDMS), are summarized to visually portray actual service levels and meaningful system performance characteristics. To demonstrate the potential utility of the resulting performance reports, summarized data in illustrative charts are evaluated from a managerial point of view. The resulting graphs can stimulate relevant analyses for modeling the impact of forecasted workloads on system service level objectives and identifying problems or trends that need the attention of system tuners. 15 figs.

46782 (INFO–0055(Rev.1)) **Safety objectives for nuclear activities in Canada.** Atomic Energy Control Board, Ottawa, ON (Canada). Apr 1982. 18p. (In English, French). (ACNS–2). Order Number DE89635654/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

French version included.

This report by the Advisory Committee on Nuclear Safety presents a concise statement of the basic safety objectives which the Committee considers underlie, or should underlie, the regulations and the licensing and compliance practices of the Atomic Energy Control Board. The report also includes a number of general criteria for achieving these objectives.

9905 Civilian Defense

46783 (AD-A–207654/5/XAB) **Ground-based radar (GBR): environmental assessment. Final report.** Army Strategic Defense Command, Huntsville, AL (USA). Mar 1989. 131p. Available from NTIS, PC A07/MF A01.

The President's Strategic Defense Initiative (SDI), announced on March 23, 1983, initiated an extensive research program to determine the feasibility of developing an effective ballistic missile defense system. The technological progress made on the SDI research program since 1983 has advanced at an unexpectedly fast pace and is still accelerating. Recognizing that no strategic defense system could be deployed all at once, the Strategic Defense Initiative Organization is using an evolutionary approach to strategic concept addressing the question of how to deploy or deploy. In September 1987, some technologies were advanced from the Concept Exploration phase of the material acquisition process to the Concept Demonstration and Validation phase under this approach, because they were judged to be mature enough in concept definition to warrant further evaluation.

46784 (AD-A–207806/1/XAB) **Annual report to the Strategic Defense Initiative organization on the free-electron laser driven by the NIST c-w microtron. Annual report, 1 April 1988-31 March 1989.** Johnson, R.G. National Inst. of Standards and Technology, Gaithersburg, MD (USA). 5 May 1986. 101p. Available from NTIS, PC A06/MF A01.

Excellent progress was made during the reporting year on all areas critical to the NIST-NRL FEL project. A contract for the construction of a wiggler was signed early in this reporting period. The contractor has completed the engineering design of the wiggler and is well along in construction. Several methods to increase the peak current in the RTM were studied. The conceptual design of the injector for the method selected was completed. A study on the problem of mirror damage was completed, and commercial suppliers of mirrors that can withstand the high-intracavity power of the FEL were identified. The design of the room in which the FEL is located has been improved, and the design of the users area has been completed. Calculations of FEL performance have been extended to include short-pulse effects and the effects of wiggler magnetic field errors. A major activity in this period has been preparation of the RTM for one-pass acceleration to 17 MeV. One-pass tests were started, and preliminary measurements of beam quality were better than design goals by a factor of two.

46785 (AD-A–208033/1/XAB) **Comparison and analysis of strategic-defense-transition stability models. Final report.** Oelrich, I.; Bracken, J. Institute for Defense Analyses, Alexandria, VA (USA). Dec 1988. 102p. (IDA-P–2145). Available from NTIS, PC A06/MF A01.

This paper discusses the nature and causes of strategic stability and instability, how defenses affect the stability equation, problems of partial defenses and various attempts to model stability during the transition to effective defense. All of the models reviewed demonstrate that there is some stable path from no defenses to near perfect (99% effective) defenses, and the paper presents an integrated theory that shows the common nature of all of the stable paths. This paper demonstrates that the results of the various transition stability models differ not in numerical results but in the measures of stability used. Recommendations for future transition stability studies are included, based on the review of the various models. The appendices contain detailed descriptions of models used in the various transition stability studies reviewed.

46786 (AD-A–208034/9/XAB) **Strategic Defense System distributed operating system R & D (research and development) review and recommendations. Final report.** Gordon, K.D.; Linn, C.J. Institute for Defense Analyses, Alexandria, VA (USA). Apr 1989. 66p. (IDA-P–2142). Available from NTIS, PC A04/MF A01.

The Strategic Defense System (SDS) imposes a set of requirements on distributed operating systems that is not met by state-of-the-art systems. In this paper, the key requirements are identified as being real-time support, reliability/fault tolerance, and security. The extent to which these requirements are being addressed by current distributed operating system research is discussed. The three distributed operating system projects that are currently receiving SDIO funds - Alpha, Cronus, and Mach - are reviewed. A fourth project, the V-distributed system project of Stanford University, is also highlighted, because of its unique potential for meeting certain SDS needs. Recommendations on the directions in which the SDIO should pursue each of these projects are made. The Office of Naval Research (ONR) Real-Time Computing Initiative, which is addressing some issues critical to the development of the SDS, is described. It is recommended that the SDIO seek to coordinate with the ONR in this effort. The appendix to this paper provides detailed descriptions of the Alpha, Cronus, Mach, and V-distributed operating system projects, as well as three other projects noted in the body of the paper: Amoeba, Clouds, and the Heterogeneous Computer Systems (HCS) Project.

46787 (ORNL/TM–10995) **Recent ORNL [Oak Ridge National Laboratory] improvements to the HULL hydrocode system.** Burns, T.J. Oak Ridge National Lab., TN (USA). May 1989. 41p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. Order Number DE89015649/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Modifications to the HULL hydrocode system are described. The modifications concern the problem generator of the system, KEEL. Revised algorithms for implementing combinatorial geometry, defining reference geometries, material "packaging," and restarting two- and three-dimensional calculations are described. The user input necessary to exercise the added/improved features is outlined and examples illustrating the revised capabilities are provided. 1 ref., 7 figs.

46788 (PB–89-209357/XAB) **Assessment of space-power-related measurement requirements of the Strategic Defense Initiative. Technical note (Final).** Olthoff, J.K.; Hebner, R.E. National Inst. of Standards and Technology, Gaithersburg, MD (USA). Apr 1989. 147p. (NIST/TN–1259). Available from NTIS, PC A07/MF A01.

Also available from Supt. of Docs. as SN003-003-02930-1.

A survey was performed to determine the measurement requirements of space-power-related parameters for anticipated SDI systems. These requirements were compared to present state-of-the-art metrology capabilities as represented by the calibration capabilities of the National Institute of Standards and Technology. Metrology areas where present state-of-the-art capabilities are inadequate to meet SDI requirements are discussed, and areas of metrology-related research that appear promising to meet these needs are examined. Particular attention is paid to the difficulties of long-term, unattended sensor calibrations and long-term measurement reliability.

46789 (UCID–21736) **XRLSim model specifications and user interfaces.** Ng, L.C.; Gavel, D.T.; Shectman, R.M.; Sholl, P.L.; Woodruff, J.P. Lawrence Livermore National Lab., CA (USA). Apr 1989. 92p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89015183/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

This report summarizes our FY88 engineering development effort of XRLSim — an Ada-based computer program developed to provide a realistic simulation of an x-ray laser weapon platform. XRLSim can be used to assess platform requirements in track handoff, target acquisition, tracking, and pointing as well as engagement time line. Development effort continues in FY89 to enhance the model fidelity of the platform and to improve the performance of the tracking algorithms. Simulated targets available in XRLSim include midcourse reentry vehicles and orbiting satellites. At this time, the current version of XRLSim can only simulate a one-on-one engagement scenario. 8 refs., 26 figs.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in *DOE Energy Data Base: Corporate Author Entries* (DOE/TIC-4585). Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, also abbreviated; and (3) the language of the document if non-English (R;US;In French). Author affiliations are not listed in this index.

Control of water infiltration into near surface LLW [low-level radioactive waste] disposal units: Progress report, 14:44758 (R;US)
Observational techniques for solar flare gamma-rays, hard X-rays, and neutrons. Final report, 1 November 1983-30 November 1988, 14:46001 (R;US)

California Univ., Berkeley, CA (USA). Electronics Research Lab.
Plasma theory and simulation. Quarterly progress report Nos. 1-2, 1 January-30 June 1988, 14:46663 (R;US)

California Univ., Los Angeles, CA (USA)
[Medium energy particle physics]: Annual progress report, 14:46444 (R;US)

California Univ., Los Angeles, CA (USA). Inst. for Plasma and Fusion Research
PISCES program plasma-surface interactions research: Summary of research, 1988–1989, 14:46724 (R;US)

California Univ., San Francisco, CA (USA). Cardiovascular Research Inst.
Studies on air pollution: Effects of nitrogen dioxide on airway caliber and reactivity in asthmatic subjects; effects of nitrogen dioxide on lung lymphocytes and macrophage products in healthy subjects; nasal and bronchial effects of sulfur dioxide in asthmatic subjects. Final report, 26 June 1987-26 November 1988, 14:46327 (R;US)

Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada)
Evaluation of heat affected zone and weld metal toughness in selected steels, phase 1, vol. 1. Final report, 14:45454 (R;CA)

Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Mineral Sciences Labs.
Characterization of Canadian fly ash and their relative performance in concrete, 14:45411 (R;CA)

Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Mining Research Labs.
Gamma-ray methodology for the determination of lead-210 in mineralogical materials, 14:45622 (R;CA)

Canada Centre of Mineral and Energy Technology, Ottawa, ON (Canada). Metals Technology Labs.
Certified nondestructive testing personnel to Canadian General Standards Board. Supplementary list to December 31, 1988, 14:45858 (R;CA;In English and French)

Canada Mortgage and Housing Corp., Ottawa, ON (Canada)
Residential combustion venting failure. A systems approach. Final technical report. Project 5: Remedial measures for wood-burning fireplaces, 14:45874 (R;CA)
Residential combustion venting failure. A systems approach. Summary report, 14:46069 (R;CA)

Canada Oil and Las Lands Administration, Ottawa, ON (Canada)
Environmental Studies Research Funds annual report, 1988, 14:45235 (R;CA;In English and French)

Canada/New Brunswick Agreement on Conservation and Alternative Energy Activities, Fredericton, NB (Canada)
Energy Educators of New Brunswick annual report, 1987-1988, 14:45433 (R;CA)
Wood-fired boiler workshop, 14:44860 (R;CA)

Canadian Electrical Association, Montreal, PQ (Canada)
Assessment of the energy use in the traditional ceramic industry in Canada, 14:45170 (R;CA)

Canadian Energy Research Inst., Calgary, AB (Canada)
Towards a commercial future. Ethanol and methanol as alternative transportation fuels, 14:44838 (R;CA)

Canadian National Committee, World Energy Conference, Ottawa, ON (Canada)
Energy in western Canada. The potential, the markets and the money, 14:45173 (R;CA)

Canadian Petroleum Association, Calgary, AB (Canada)
Canadian Petroleum Association annual report, 1988, 14:44462 (R;CA;In English and French)

Carleton Univ., Ottawa, ON (Canada). Faculty of Engineering
Stress intensity factors for weld toe cracks in welded T plate joints, 14:45459 (R;CA)

Carnegie-Mellon Univ., Pittsburgh, PA (USA)
Radon transform analysis of a probabilistic method for image generation. Annual report No. 2, 1 April 1988-31 March 1989, 14:46744 (R;US)

CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete
Historical seismicity in Morocco: methodological aspects and cases of multidisciplinary evaluation, 14:46351 (R;FR)

CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Physico-Chimie
High-frequency paleoclimatic variability: a spectral analysis of the Vostok ice-core isotopic record, 14:46058 (R;FR)

Center for Planning and Research, Inc., Palo Alto, CA (USA)
Money, credit, and banking in a national security emergency, 14:45204 (R;US)
Price stabilization in a national security emergency, 14:45202 (R;US)
Rationing in a national security emergency, 14:45203 (R;US)
Wage and salary stabilization in a national security emergency, 14:45205 (R;US)

Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro, RJ (Brazil)
Magnetism of classical and quantum systems of localized spins, 14:46598 (R;BR;In Portuguese)
Study of hyperfine interactions in V_2O_3 by angular correlation, 14:45528 (R;BR;In Portuguese)
Vacuum ultraviolet spectroscopy of some hydrocarbons by electron impact technique, 14:45995 (R;BR;In Portuguese)

Centro Tecnico Aeroespacial, Sao Jose dos Campos, SP (Brazil). Inst. de Estudos Avancados
Implementation of plot options for the NJOY module DTFR, 14:44663 (R;BR)
Nuclear data catalogue, 14:45060 (R;BR;In Portuguese)

Ceramics Process Systems Corp., Cambridge, MA (USA)
Highly oriented fiber-reinforced ceramic composites. Final report, 1 August 1988-31 January 1989, 14:45552 (R;US)

Chemical Research, Development and Engineering Center, Aberdeen Proving Ground, MD (USA)
Toxicity of Jet A (aviation fuel) selected aquatic organisms. Technical report, August 1987-February 1988, 14:44510 (R;US)

Chemsyn Science Labs., Lenexa, KS (USA)
Synthesis of radiolabeled chemical agents/precursors. Final summary report, 1 March 1984-30 September 1986, 14:45730 (R;US)

Christian Michelsens Inst. for Vitenskap og Aandsfrihet, Bergen (Norway)
Generating oil price processes from economic arguments, 14:44505 (R;NO)
Resource situation in a global perspective, 14:44466 (R;NO;In Norwegian)
Socio-economic correct pricing of Norwegian natural gas for domestic electric power production, 14:44601 (R;NO;In Norwegian)
Value of the Norwegian natural gas, 14:44602 (R;NO;In Norwegian)

Clemson Univ., SC (USA). Dept. of Chemistry
Novel fluorinated acids for phosphoric acid fuel cells. Annual report, Aril 1987-March 1988, 14:45317 (R;US)

Cold Regions Research and Engineering Lab., Hanover, NH (USA)
Influence of well casing composition on trace metals in ground water. Special report, 14:46163 (R;US)

Columbia Univ., New York, NY (USA)
Ion temperature gradient instability: Progress report, 14:46674 (R;US)

Combustion Engineering, Inc., Windsor, CT (USA)
The evaluation and demonstration of methods for improved nuclear fuel utilization: Eleventh progress report, January 1, 1987–September 30, 1988, 14:45037 (R;US)

Comissao Nacional de Energia Nuclear, Rio de Janeiro, RJ (Brazil). Dept. de Reatores
Angra-1 probabilistic safety study-phase B, 14:45033 (R;BR;In Portuguese)
Generic nuclear power plant component failure data bank, 14:45035 (R;BR;In Portuguese)
SEDA computer code and its utilization for Angra 1, 14:45113 (R;BR;In Portuguese)
Utilization of "RASO" for a historical survey of Angra-1 power from 26.10.88 for updating the inventory calculation, 14:45034 (R;BR;In Portuguese)

Commission of the European Communities, Brussels (Belgium)
DOE/CEC [Department of Energy/Commission of the European Communities] workshop on critical evaluation of radiobiological data to biophysical modeling, 14:46284 (R;US)

Commission of the European Communities, Luxembourg (Luxembourg)
About the reaction between uranium-americium mixed oxides and sodium, 14:45731 (R;FR;In German)
Aerosol measurements and nuclear accidents: a reconsideration, 14:45117 (R;FR)
Health and safety in the nuclear age, 14:46290 (R;FR)

Computer Command and Control Co., Philadelphia, PA (USA)
Intelligent mathematical modeling system - MATHMODEL. Final report, 1 August 1988-31 March 1989, 14:46743 (R;US)

Computer Software Management and Information Center, Athens, CA (USA)
Seventeenth NASTRAN (R) Users' Colloquium, 14:45765 (R;US)

Consumer and Corporate Affairs Canada, Ottawa, ON (Canada)
Consumer and Corporate Affairs Canada Consumer Energy Conservation Research Program summary of achievements, 14:45320 (R;CA)
Transportation energy conservation, 14:45391 (R;CA)

Coors Ceramics Co., Golden, CO (USA)
Ceramic-tube material and processing development: development of slip-cast and extruded-reaction-bonded silicon carbide components for gas-fired furnaces. Final report, February 1982-October 1987, 14:44618 (R;US)

Cornell Univ., Ithaca, NY (USA). School of Chemical Engineering
Multicomponent e-beam resists containing organometallic compounds and reactive monomers. Technical report, 14:46414 (R;US)

Cranfield Inst. of Tech., Bedford (UK)
Effect of meteorological parameters on wind turbine behaviour - an analytical study, 14:44980 (R;GB)

Croasdale (K.R.) and Associates, Calgary, AB (Canada)
Measurement of the properties of broken ice zones and ice rubble, 14:45881 (R;CA)

D

Daimler-Benz A.G., Stuttgart (Germany, F.R.)
Production processes of ceramic turbine wheels suitable for a car gas turbine. Final report, 14:45440 (R;DE;In German)

Dames and Moore, London (UK)
Report of a seminar on natural environmental change, 14:44711 (R;GB)

Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Energiteknik
Internal combustion engine. Fuel feed and power control, 14:45438 (R;DK;In Danish)
Simulation of miscible gas displacement with a finite element compositional simulator, 14:44482 (R;DK)

Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varme- og Klimateknik
Conditions of radiation in large boilers and furnaces. Ribbon radiation models, 14:45743 (R;DK;In Danish)

Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varmeisolering
Avoidance of failures in solar collector system. IEA Task 3: performance testing of solar collectors, Subtask F: service life testing of solar collector components and materials, 14:44936 (R;DK)
Danish export of solar heating technology. Danish produced self-circulating solar heating units, testing - recommendations, 14:44934 (R;DK;In Danish)
High-yield solar heating system with low volume flow. Experimental investigations, 14:44930 (R;DK;In Danish)
Proceedings from workshop on service life of solar collector components and materials. IEA Task 3: performance testing of solar collectors, Subtask F: service life testing of solar collector components and materials, 14:44939 (R;DK)

Dansk Hydraulisk Inst., Hoersholm (Denmark)
Analysis of prototype freak waves, 14:45886 (R;DK)

Dansk Olie og Naturgas A/S, Copenhagen (Denmark)
Geothermal energy. Program evaluation, 14:44971 (R;DK;In Danish)

Danske Fjernvarmevaerkers Forening, Kolding (Denmark)
Technology regulations for district heating delivery. DFF-vejledning, 14:45424 (R;DK;In Danish)

Dartmouth Coll., Hanover, NH (USA). Dept. of Chemistry
Photoexcited charge pair escape and recombination: Progress report, August 1, 1986–March 1, 1989, 14:45724 (R;US)

Defence Research Establishment Suffield, Ralston, AB (Canada)
Upper bound on the-threshold crossing probability for short-time exposure dosage with implications for the assessment of hazard from toxic vapors. Memorandum report, 14:46321 (R;CA)

Delmarva Power and Light Co., Wilmington, DE (USA)
Ash utilization in highways: Delaware demonstration project, 14:44444 (R;US)

Denison Univ., Granville, OH (USA)
Neutron cross section measurements using the Oak Ridge electron linear accelerator: Performance report, July 1988–July 1989, 14:46525 (R;US)

Department of Energy and Forestry, Charlottetown, PE (Canada)
Prince Edward Island Dept. of Energy and Forestry annual report, 1987-1988, 14:45221 (R;CA)
Prince Edward Island Energy Corporation annual report, 1987-1988, 14:45305 (R;CA)

Department of Energy, London (UK)
Designer's manual for the energy efficient refurbishment of housing, 14:45357 (R;GB)

Department of Energy, Mines and Resources, Ottawa, ON (Canada)
Small power production in remote communities. A shared opportunity, 14:44976 (R;CA)
Super energy efficient housing and solar orientation. A research report, 14:45423 (R;CA)
The common eider (Somateria mollissima sedentaria) of eastern Hudson Bay. A survey of nest colonies and Inuit ecological knowledge, 14:46123 (R;CA)

Department of Energy, Mines and Resources, Ottawa, ON (Canada). Renewable Energy Resources Branch
Canadian renewable energy prospects, 14:45306 (R;CA)

Department of Fisheries and Oceans, Ottawa, ON (Canada)
Acidification of surface waters in eastern Canada and its relationship to aquatic biota, 14:46170 (R;CA;In French)

Department of Health and Human Services, Washington, DC (USA)
In-vivo method for determining and imaging temperature of an object/subject from diffusion coefficients obtained by nuclear magnetic resonance, 14:46272 (P;US)

Department of Indian and Northern Affairs, Yukon, YT (Canada). Northern Oil and Gas Action Program
NOGAP bibliography, vol.3, 14:44464 (R;CA)

Department of the Army, Washington, DC (USA)
Method of creating a large magnetic field in a hollow cylindrical superconducting ring, 14:45782 (P;US)

Department of the Environment, London (UK)
Report of a seminar on natural environmental change, 14:44711 (R;GB)

Department of the Interior, Washington, DC (USA)
Directional harmonic overcurrent relay device, 14:45017 (P;US)

Det Norske Veritas (Canada) Ltd. (Canada)
Development of a model for progressive damage in ice, 14:45883 (R;CA)
Probabilistic framework for ice loads on fixed marine structures. Vol. 1, study description, 14:45884 (R;CA)
Probabilistic framework for ice loads on fixed marine structures. Vol. 2, user's guide to load computer package, 14:45882 (R;CA)

Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.)
Efficiency analysis of MR-imaging (investigations accompanying clinical tests) - work carried out so far. Interim report, 14:46239 (R;DE;In German)

Deutsche Landwirtschafts-Gesellschaft e.V., Frankfurt am Main (Germany, F.R.)
The inhibiting effect of calcium at higher pollutant burdens, 14:46324 (R;DE;In German)

Deutsche Wissenschaftliche Gesellschaft fuer Erdoel, Erdgas und Kohle e.V., Hamburg (Germany, F.R.)
Evaluation of approximation equations - approximation and extrapolation of pressure viscosity measuring of mineral oils, 14:44529 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 1, 14:44475 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2 - experimental investigations. Final report. Pt. 2, 14:44476 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 3. Numerical simulation, 14:44477 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 4. Procedure of technical CO_2 at substantial lower costs compared to pure CO_2, 14:44478 (R;DE;In German)
Kerogenous and bituminous intercalations within the Hauptdolomit (Upper Triassic, Eastern Alps): Model of a carbonate source rock. Final report, 14:44469 (R;DE;In German)
Macrophyte-based biological treatment of effluent from a petroleum tank farm. Final report, 14:44507 (R;DE;In German)

Dieseldyne Corp., Morrow, OH (USA)
Study of an advanced variable-cycle diesel as applied to an RPV (remotely piloted vehicles). Final report, 11 August 1988-28 February 1989, 14:45434 (R;US)

Dome Petroleum Ltd., Calgary, AB (Canada)
Guide to dispersant. Use decision making for oil spills in the Canadian southern Beaufort Sea, 14:44522 (R;CA)
Dominion Aluminum Fabricating Ltd., Cooksville, ON (Canada)
Development, installation and testing of a wind turbine diesel hybrid, 14:44978 (R;CA)

E

EA-Mueller, Inc., Baltimore, MD (USA)
Research and development opportunities in supercritical fluid technology: Final report, 14:45400 (R;US)
Ebasco Services, Inc., Bellevue, WA (USA)
Low-level radioactive waste volume reduction and stabilization technologies resource manual: National Low-Level Radioactive Waste Management Program, 14:44707 (R;US)
Ecole Centrale des Arts et Manufactures, 92 - Chatenay-Malabry (France)
Contribution to the optimal synthesis of heat exchanger networks: computer programs proposition, 14:45412 (R;FR;In French)

Assessing multiple pollutant multiple source cancer risks from urban air toxics: Summary of approaches and insights from completed and ongoing urban air toxics-assessment studies, 14:46099 (R;US)
Model boiler cost analysis for controlling nitrogen oxides (NOx) emissions from small-steam generating units. Final report, 14:45002 (R;US)
Overview of the regulatory baseline, technical basis, and alternative control levels for nitrogen oxides (NOx) emission standards for small steam generating units. Final report, 14:45001 (R;US)
Projected impacts of alternative new source performance standards for small industrial-commercial-institutional fossil fuel-fired boilers. Final report Final report, 14:45003 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Drinking Water
Occurrence of synthetic volatile organic chemicals in drinking water, food, and air (revised draft), July 1987, 14:45183 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response
Superfund Record of Decision (EPA Region 2): Montgomery Township Housing Development, New Jersey (second remedial action), June 88. Final report, 14:46188 (R;US)
Superfund Record of Decision (EPA Region 7): Fulbright/Sac River Landfill, Missouri (first remedial action), September 1988. Final report, 14:46153 (R;US)
Superfund Record of Decision (EPA Region 4): Independent Nail, Beaufort, Beaufort County, South Carolina (second remedial action), August 1988. Final report, 14:45418 (R;US)
Superfund Record of Decision (EPA Region 3): Middletown Air Field, Pennsylvania (first remedial action), December 1987, 14:45426 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Pesticide Programs
Pesticides in ground-water data base: 1988 interim report, 14:46174 (R;US)

Esbensen og Korsgaard Raadgivende Civilingenioerer, Copenhagen (Denmark)
Danish export of solar heating technology. Danish produced self-circulating solar heating units, testing - recommendations, 14:44934 (R;DK;In Danish)
Danish export of solar-heating technology. The market in the Sudan, Senegal and Kenya, 14:44889 (R;DK;In Danish)
Danish export of solar-heating technology. Demands for functional efficiency in the case of solar collectors used in the developing countries, 14:44935 (R;DK;In Danish)
Danish solar hot water systems, 14:44931 (R;DK)

Esso Resources Canada Ltd., Calgary, AB (Canada). Research Dept.
Simple remote sensing for the detection of oil on water, no. 98, 14:44512 (R;CA)

European Research Office, London (UK)
Iron disilicide thermoelectric generator. Final report, 1 August 1988-15 April 1989, 14:45314 (R;GB)

EXPORTech Co., Inc., New Kensington, PA (USA)
Pitt Mill demonstration: Quarterly technical progress report, January–March 1989, 14:44410 (R;US)
Pitt Mill demonstration: Quarterly technical progress report, April–June 1989, 14:44411 (R;US)

F

Federal Aviation Administration, Washington, DC (USA). Office of Aviation Medicine
Inhalation toxicology. 9. Times-to-incapacitation for rats exposed to carbon monoxide alone, to hydrogen cyanide along, and to mixtures of carbon monoxide and hydrogen cyanide. Technical report, January-November 1986, 14:46322 (R;US)

Fermi National Accelerator Lab., Batavia, IL (USA)
A Main Ring bunch length monitor by detecting two frequency components of the beam, 14:45958 (R;US)
A missing transverse energy analysis of 1.8 TeV $\bar{p}$-p collisions observed at CDF, 14:46435 (R;US)
A new semicustom integrated bipolar amplifier for silicon strip detectors, 14:45864 (R;US)
Improved bunch spreader modules, 14:45931 (R;US)
New tools for the simulation and design of calorimeters, 14:45989 (R;US)
Performance of the CAMEX64 silicon strip readout chip, 14:45991 (R;US)

Piping instability resulting from bellows misalignment, 14:45957 (R;US)
Radiation measurements inside the CDF detector, 14:45992 (R;US)
Spontaneous symmetry breaking in 4-dimensional heterotic string, 14:46491 (R;US)
SSC superconducting dipole magnet cryostat model style B construction experience, 14:45956 (R;US)
Technical memo on PbF_2 as a Cherenkov radiator for EM calorimetry, 14:45990 (R;US)
The theory of heavy flavour production, 14:46452 (R;US)

Fleet Technology Ltd., Kanata, ON (Canada)
Tests to evaluate the effect of a waterjet barrier on the burning efficiency of a floating oil slick, 14:44513 (R;CA)

Florida State Univ., Tallahassee, FL (USA)
Fiber tower calorimeter continuation proposal and status report, 14:46015 (R;US)

Florida Univ., Gainesville, FL (USA). Dept. of Physics
Studies of novel superconductors: Progress report, January 1, 1989–December 31, 1989, 14:46620 (R;US)

Forschungsgesellschaft Wolfsburg m.b.H. fuer Energie-, Wasser- und Verkehrstechnik (Germany, F.R.)
Low-temperature heating for the new building area Glockenberg in Wolfsburg. Final report, 14:45355 (R;DE;In German)

Foster-Miller, Inc., Waltham, MA (USA)
Valve motor operator improvements: Final report, 14:45069 (R;US)

Frankfurt Univ. (Germany, F.R.)
The role of the viscosity in the hydrodynamic model of high-energetic heavy ion reactions, 14:46548 (R;DE;In German)

Fraunhofer-Institut fuer Bauphysik, Stuttgart (Germany, F.R.)
A simple hybrid system for saving heat by means of a pebble storage unit and a glazed attic, 14:45359 (R;DE;In German)

Fraunhofer-Institut fuer Systemtechnik und Innovationsforschung (ISI), Karlsruhe (Germany, F.R.)
Investigation of a demand-oriented digester gas production in the framework of the CHP concept in the waste water treatment plant Aistaig of Oberndorf a. Neckar. Final report, 14:44894 (R;DE;In German)

Freiburg Univ. (Germany, F.R.). Geologisches Inst.
Kerogenous and bituminous intercalations within the Hauptdolomit (Upper Triassic, Eastern Alps): Model of a carbonate source rock. Final report, 14:44469 (R;DE;In German)

G

Garrett Mfg. Ltd., Rexdale, ON (Canada)
Research and development into new technologies associated with low cost thin film solar cells, 14:44893 (R;CA)

Gas Research Inst., Chicago, IL (USA)
Putting R and D (research and development) results to work: the role of technology transfer. Annual report, 14:44606 (R;US)
Role of basic research in the gas industry: Technical video brief, 14:44604 (R;US)
Transmission operations research status report: 1987 projects, 14:44614 (R;US)

Gas Research Inst., Washington, DC (USA). Strategic Analysis and Energy Forecasting Div.
Industrial natural gas markets: facts, fallacies, and forecasts. Topical report, 14:44605 (R;US)

General Electric Co., Pittsfield, MA (USA)
PCB [polychlorinated biphenyl] residues in transformer carcasses: Final report, 14:45007 (R;US)

General Electric Co., Richland, WA (USA). Hanford Atomic Products Operation
Interim report on the origin of reactor effluent water radioisotopes: Analysis of Turco purge material, 14:46183 (R;US)
Radionuclides in an abandoned reactor facility, 14:44810 (R;US)

General Electric Co., Shippingport, PA (USA)
Progress in the release of the Shippingport site and materials, 14:44808 (R;US)

General Motors Corp., Indianapolis, IN (USA). Allison Gas Turbine Div.
Advanced Gas Turbine (AGT) Technology Project: Final report, 14:45437 (R;US)

General Physics Corp., San Diego, CA (USA)
Boiler tube failure: Correction, prevention, and control: Final report, 14:44991 (R;US)

Geological Survey of Canada, Ottawa, ON (Canada)
Current research, part H. Frontier geoscience program, Queen Charlotte Islands, British Columbia, 14:46342 (R;CA)

Geological Survey, Idaho Falls, ID (USA)
Stratigraphy of the unsaturated zone at the Radioactive Waste Management Complex, Idaho National Engineering Laboratory, Idaho, 14:44704 (R;US)

George Mason Univ., Fairfax, VA (USA). School of Law
Examination of the legal mechanisms to regulate advanced fision reactors, 14:45206 (R;US)

Georgia Inst. of Tech., Atlanta, GA (USA). School of Electrical Engineering
Two-dimensional signal processing and storage and theory and applications of electromagnetic measurements. Annual report, 1 January-31 December 1988, 14:46746 (R;US)

Georgia State Univ., Atlanta, GA (USA). Dept. of Physics
Differential cross sections for secondary electron production by 1.5-keV electrons in water vapor, 14:46386 (R;US)

Georgia Univ., Athens, GA (USA)
Anaerobic biodegradation of 2,4-dichlorophenol in freshwater lake sediments at different temperatures, 14:46176 (R;US)

Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Garching (Germany, F.R.)
Energy: The endless story. The energy issue in the course of history, 14:45169 (R;DE;In German)
List of reports in the field of reactor safety research of BMFT, CEA, EPRI, JSTA and USNRC. Reported period: January 1 to March 31, 1989, 14:45134 (R;DE;In German)

Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)
Research for enhancing reactor safety, 14:45126 (R;DE;In German)

Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)
1.4 decades of 1.4 MeV/u heavy ion beams, 14:46509 (R;DE)
Correlated electron-positron emission in heavy-ion collisions, 14:46402 (R;DE)
KOBRA 3 - a code for the calculation of space-charge-influenced trajectories in 3-dimensions, 14:45932 (R;DE)
Optimization and extension of the GSI double-orange apparature for the study of e^+e^- pairs emitted in heavy ion collisions, 14:45993 (R;DE;In German)
Production, transport and charge capture measurements of highly charged recoil ions, 14:45994 (R;DE)
The independent quark-gluon string model for heavy-ion collisions at ultrarelativistic energies, 14:46550 (R;DE)
The nuclear equation of state in effective relativistic field theories and pion yields in heavy-ion collisions, 14:46549 (R;DE)
The role of the viscosity in the hydrodynamic model of high-energetic heavy ion reactions, 14:46548 (R;DE;In German)

Gesellschaft zur Foerderung der Heizungs- und Klimatechnik m.b.H. (GFHK), Hilden (Germany, F.R.). Zentralstelle fuer Solartechnik
Efficient use of solar energy in solar heated swimming pools, 14:44888 (R;DE;In German)

GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)
Atmospheric input of trace substances into the North Sea and the Baltic Sea, 14:46077 (R;DE;In German)

GRAM, Inc., Albuquerque, NM (USA)
Comparison of strongly heat-driven flow codes for unsaturated media, 14:44759 (R;US)

Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)
Observation of new neutron rich nuclei ^{29}F, ^{35}Mg, ^{36}Mg, ^{38}Al, ^{39}Al, ^{40}Si, ^{41}Si, ^{43}P, ^{44}P, ^{45}S, ^{47}S, ^{46}Cl, ^{49}Cl and ^{49}Ar, ^{51}Ar from the interactions of 55 MeV/u ^{48}Ca + Ta, 14:46532 (R;FR)

Gruppen for Ressursstudier, Oslo (Norway)
Adventure or necessity?. Decade-periodic experiences with politics for energy conservation in Scandinavia, 14:45219 (R;NO;In Norwegian)

Comparative study of the Scandinavian measures for energy conservation. Measures, experiences, and measuring problems - results from a pre-project, 14:45190 (R;NO;In Norwegian)
Cost management in a sales economy. A study of cost disrepancies in governmental power development, 14:44886 (R;NO;In Norwegian)
Encouraging household energy conservation: Have Nordic incentive strategies been grounded in research results?, 14:45192 (R;NO)
Evaluation of the energy conservation prototype program. Supplementary report : Mapping, 14:45191 (R;NO;In Norwegian)
How to succeed in the energy market?. A report from a preliminary project, 14:45174 (R;NO;In Norwegian)
Social consequences from various energy technologies. Evaluation procedures, 14:45182 (R;NO;In Norwegian)
Stabilization of the energy consumption in Norway. Energy and environment, 14:45304 (R;NO;In Norwegian)
Which way to succeed on the energy markets?. A study of the heat pumps and hydraulic turbines in Scandinavia, 14:45193 (R;NO;In Norwegian)

H

Hampton Inst., VA (USA)
Effects of cosmic rays on single event upsets. Status report, 14:45563 (R;US)
Hanford Engineering Development Lab., Richland, WA (USA)
2000-hour stress-corrosion cracking tests on 90-10 cupronickel in simulated Hanford groundwater, 14:44724 (R;US)
Hanford Works, Richland, WA (USA)
Fish and fish problems of the Hanford Reservation, 14:46171 (R;US)
Radiological Sciences Department investigation: Radiation Incident Class 1, No. 536-C, 14:44809 (R;US)
Harding-Lawson Associates, Novato, CA (USA)
Ox Mountain sanitary landfill: Apanolio Canyon expansion site, San Mateo County, California. Volume 1. Final EIS (Environmental Impact Statement) and response to comments. Final report, 14:46128 (R;US)
Hay Group, Washington, DC (USA)
1989 National Compensation Survey of Research and Development Scientists and Engineers: Final report: Data effective date: January 15, 1989, 14:46736 (R;US)
Hoechst A.G., Frankfurt am Main (Germany, F.R.)
Large heat pumps for heat recovery in industrial companies, 14:45401 (R;DE;In German)
Hoffman (S.), Mountain View, CA (USA)
Acid precipitation and human health: Final report, 14:46075 (R;US)
Howard Univ., Washington, DC (USA)
Evaluation, development, and characterization of superconducting materials for space application. Semiannual progress report No. 2, 14:45562 (R;US)
Hubbs Marine Research Inst., San Diego, CA (USA)
Sea otter oil spill avoidance study, 14:44518 (R;US)
Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics
Analysis of the neutral gas measurements near comet P/Halley based on observations by VEGA-1, 14:46373 (R;HU)
Liquid layer model for non-magic nuclei, 14:46559 (R;HU)
On prompt fission neutrons, 14:46560 (R;HU)
Simple expression for the entropy of a fireball from experimental strange particle ratios, 14:46472 (R;HU)
Hydro-Quebec, Montreal, PQ (Canada)
Hydro-Quebec annual report, 1988, 14:45284 (R;CA;In French)
[Hydro-Quebec] Proposed tariffs for 1989, 14:45285 (R;CA;In French)

I

Idaho Univ., Moscow, ID (USA)
Electrochemistry of Thiobacillus ferrooxidans reactions with pyrite: Technical progress report, April 15–August 15, 1989, 14:44421 (R;US)
IEA Heat Pump Center, Eggenstein-Leopoldshafen (Germany, F.R.)
Comparison of national standards. Testing and rating procedures for heat pumps, 14:45358 (R;DE)
Illinois State Water Survey Div., Champaign, IL (USA). Ground-Water Section
Regional ground-water quality characterization of the Rockford area, Winnebago County, Illinois: An assessment of volatile organic compounds and selected trace metals, 14:46175 (R;US)
Illinois Univ., Urbana, IL (USA)
$CuInSe_2$ solar cell research by sputter deposition: Final subcontract report, January 1985–November 10, 1987, 14:44908 (R;US)
[Photosynthesis in intact plants]: Progress report, 14:44891 (R;US)
Illinois Univ., Urbana, IL (USA). Dept. of Mechanical and Industrial Engineering
Experimental and numerical studies of laser-sustained gas plasmas. Final report, 1 February 1988-15 March 1989, 14:46701 (R;US)
Illinois Univ., Urbana, IL (USA). Inst. of Environmental Studies
Refining the degree of hazard ranking methodology for Illinois industrial waste streams, 14:45417 (R;US)
Illinois Univ., Urbana, IL (USA). Survey Research Lab.
Participation in a household hazardous-waste collection drive and 'before' and 'after' public knowledge and disposal practices: Champaign County. Technical report, 14:45425 (R;US)
Imatran Voima Oy, Helsinki (Finland)
Mechanical vibration caused by wind, 14:45008 (R;FI;In Finnish)
Imperial Coll. of Science and Technology, London (UK)
Predictive experience of CCRL tunnel furnace for powdered coal firing, 14:45876 (R;CA)
Industri- og Handelsstyrelsen, Copenhagen (Denmark). Formidlingsraadet
Presentation of low cost contribution to hydrocarbon projects, 14:44485 (R;DK)
Industrie Abwasser Technik (IAT), Ganderkesee (Germany, F.R.)
Macrophyte-based biological treatment of effluent from a petroleum tank farm. Final report, 14:44507 (R;DE;In German)
Industrieanlagen-Betriebsgesellschaft m.b.H., Ottobrunn (Germany, F.R.). Haputabteilung Zentrale Studinen
Efficiency analysis of MR-imaging (investigations accompanying clinical tests) - work carried out so far. Interim report, 14:46239 (R;DE;In German)
Information and Control Systems, Inc., Hampton, VA (USA)
Development and simulation study of a new inverse-pinch high Coulomb transfer switch. Final report, 14:46718 (R;US)
Institut Biofiziki, Moscow (USSR)
Radiopharmaceuticals in oncology. Collection of scientific papers, 14:45736 (R;SU;In Russian)
Institut Forestier National de Petawawa, Chalk River, ON (Canada)
Systems of equations to calculate the anhydrons mass of 18 Canadian species of trees, 14:44898 (R;CA;In French)
Institut fuer Erdoelforschung, Clausthal-Zellerfeld (Germany, F.R.)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 1, 14:44475 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2 - experimental investigations. Final report. Pt. 2, 14:44476 (R;DE;In German)
Institut fuer Meereskunde an der Univ. Kiel (Germany, F.R.)
Exploration ship METEOR - cruise no. 6. ATLANTIK 87/88 - legs no. 1-3 October-December 1987, 14:46169 (R;DE;In German)
Institut fuer Solarenergieforschung m.b.H. (ISFH), Hannover (Germany, F.R.)
Efficient use of solar energy in solar heated swimming pools, 14:44888 (R;DE;In German)
Institut Wohnen und Umwelt G.m.b.H., Darmstadt (Germany, F.R.)
Residential development planning in new development areas with a view to energy conservation, 14:45211 (R;DE;In German)
Institute for Defense Analyses, Alexandria, VA (USA)
Comparison and analysis of strategic-defense-transition stability models. Final report, 14:46785 (R;US)

Strategic Defense System distributed operating system R & D (research and development) review and recommendations. Final report, 14:46786 (R;US)

Institute of Ecosystem Studies, Millbrook, NY (USA)
Operation and research at the Ithaca MAP3S regional precipitation chemistry site: Annual progress report for 1989, 14:46072 (R;US)

Institute of Oceanographic Sciences, Wormley (UK)
[Evaluation of the North Atlantic seasonal nitrogen model (Version 2)]: Foreign trip report, July 17–21, 1989, 14:46363 (R;US)

Institute of Sedimentary and Petroleum Geology, Calgary, AB (Canada)
Recommendations for the investigation of northern Canadian oil shale deposits, 14:44620 (R;CA)
Stratigraphy and structure of the mount Selwyn area, Rocky Mountains, northeastern British Columbia, 14:46344 (R;CA)

Instituto de Fisica Teorica, Sao Paulo, SP (Brazil)
Center-of-mass corrections in the S+V potential model, 14:46455 (R;BR;In Portuguese)
Cosmological model with Einstein - De Sitter metric and closed spatial section, 14:46369 (R;BR;In Portuguese)
Study of primitive universe in the Bianchi IX model, 14:46371 (R;BR;In Portuguese)

Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil)
Acceptance criteria for radioactive waste deposition, 14:44729 (R;BR;In Portuguese)
Analysis of the refloding pressure drop measurements, 14:45041 (R;BR;In Portuguese)
Application of isotopic dillution techniques by alpha and mass spechometry for determining uranium and evaluated its distributlon in geological materials, 14:44661 (R;BR;In Portuguese)
Bi-Sr-Ca-Cu-O superconducting ceramics, 14:45531 (R;BR;In Portuguese)
Effects of ionizing radiation in crotamine from Crotalus durissus terrificus venous, 14:46296 (R;BR;In Portuguese)
Evaluation of the laser fluorimetric method in the determination of uranium, 14:45620 (R;BR;In Portuguese)
Immobilized waste leaching, 14:44726 (R;BR;In Portuguese)
Least square methods and covariance matrix applied to the relative efficiency calibration of a Ge(Li) detector, 14:45999 (R;BR)
Photofission cross sections of U-233 and Pu-239 near threshold induced by gamma-rays from thermal neutron capture, 14:46511 (R;BR)
Production and radioiodination of monoclonal antibodies and its applications in nuclear medicine, 14:46270 (R;BR;In Portuguese)
Quality control in the radioactive waste management, 14:44727 (R;BR;In Portuguese)
Radiaoctive waste packaging for transport and final disposal, 14:44730 (R;BR;In Portuguese)
Radioactive waste treatment of the Nuclear and Energetic Research Institute (IPEN), 14:44728 (R;BR;In Portuguese)
Radionuclide migration studies in soil, 14:46145 (R;BR;In Portuguese)
Separation of ^{99}Mo from ^{132}Te using thiourea as complexing agent. Application to the separation of ^{99}Mo from the fission products, 14:45732 (R;BR;In Portuguese)
Separation of ^{99}Mo from ^{132}Te using thiourea as complexing agent. Application to the separation of ^{99}Mo from the fission products, 14:45737 (R;BR;In Portuguese)
Solid and liquid radioactive waste treatment, 14:44731 (R;BR;In Portuguese)
Status and possibilities for biomedical applications at the Instituto de Pesquisas Energeticas e Nucleares/Sao Paulo-Brazil, 14:46271 (R;BR;In Spanish)
Study of creep in stainless steel irradiated with fast neutron and alpha particles, 14:45472 (R;BR;In Portuguese)
Techniques for the identification of corrosion products, 14:45530 (R;BR;In Portuguese)

Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo, SP (Brazil). Dept. de Metalurgia Nuclear
Work hardening, recovery and recrystallization of alloys containing dispersed precipitates, 14:45479 (R;BR;In Portuguese)

Instituto de Pesquisas Espaciais, Sao Jose dos Campos, SP (Brazil)
Study on plasmaspheric electric fields and theirs influences on charged particle dynamics, 14:46385 (R;BR;In Portuguese)

Institutt for Kontinentalundersoekelser og Petroleumsteknologi A/S, Trondheim (Norway)
Chemical dispersability testing of fresh and weathered crude oils. DIWO report no. 3, 14:44530 (R;NO)
Ionosphere influences on the navigation and positioning with the Navstar Global Positioning System (GPS), 14:45885 (R;NO;In Norwegian)
Miscible displacement yearly report 1988, 14:44483 (R;NO)
Modelling of hydrocarbon generation patterns in the Egersund Sub- basin, North Sea, 14:44472 (R;NO)
Sampling of reservoir fluids, 14:44532 (R;NO;In Norwegian)
Shallow seismic digital navigation data base. Norwegian Continental Shelf, 14:46353 (R;NO)
Summary of some aspects of WAG and tertiary gas injection, 14:44484 (R;NO;In Norwegian)
W/O-emulsion formation and W/O-emulsion stability testing. DIWO report no. 4, 14:44531 (R;NO)

International Atomic Energy Agency, Vienna (Austria)
Agreement of 17 February 1989 between the United States of America and the International Atomic Energy Agency for the application of safeguards in connection with the treaty for the prohibition of nuclear weapons in Latin America, 14:44819 (R;XA)
Agreement of 23 February 1989 between the Government of the Democratic People's Republic of Algeria and the International Atomic Energy Agency for the application of safeguards in connection with the supply of a research reactor from the Republic of Argentina, 14:44817 (R;XA)
Analytical chemistry in semiconductor manufacturing: Techniques, role of nuclear methods and need for quality control. Report of a consultants' meeting on the need for intercomparison and reference materials for characterization of silicon held in Gaithersburg, Maryland, USA, 2-3 October 1987, 14:45590 (R;XA)
Atomic and molecular data for radiotherapy. Proceedings of an advisory group meeting held in Vienna, 13-16 June 1988, 14:46240 (R;XA)
Co-ordinated research programme on nuclear techniques for toxic elements in foodstuffs. Report on the second research coordination meeting, Beijing, People's Republic of China, 19-22 April 1988, 14:45599 (R;XA)
Inspection of Iraq's nuclear facilities, 14:44818 (R;XA)
Letter to the Director General from the Resident Representative of Israel, 14:44828 (R;XA)
Text of the Agreement between Belgium, Denmark, the Federal Republic of Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Spain, the European Atomic Energy Community and the Agency in connection with the Treaty on the Non-Proliferation of Nuclear Weapons, 14:44827 (R;XA)
Uranium resources and geology of North America. Proceedings of a technical committee meeting held in Saskatoon, Canada, 1-3 September 1987, 14:44625 (R;XA)

International Atomic Energy Agency, Vienna (Austria). Dept of Safeguards
Error analysis of isotope dilution mass spectrometry method with internal standard, 14:45589 (R;XA)

International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee
Nuclear data for structural materials of fission and fusion reactors. Summary of the second research coordination meeting on methods for the calculation of fast neutron data for structural materials held in Vienna, 15-17 February 1988, 14:46553 (R;XA)
PEQAG: A PC version of fully pre-equilibrium computer code with gamma emission, 14:46551 (R;XA)
Report of the Nuclear Data Section to the International Nuclear Data Committee, September 1987 to February 1989, 14:46777 (R;XA)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, *EDB Subject Thesaurus* (DOE/OSTI-7000). In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

Filtered containment venting in Sweden, 14:45150 (RA;US)
Methods of testing HEPA filters with short upstream approaches, 14:44756 (RA;US)
Proposed new approach to allow improvement of nuclear air treatment systems for power plants, 14:45102 (RA;US)
Review of nuclear air treatment system related License Event Reports for the period 1985 - 1987, 14:44741 (RA;US)

AIR CONDITIONERS
Strategies for humidity control, 14:45331 (RA;DE;In German)

AIR CONDITIONING
Technology screening tools for marketing and DSM programs, 14:45247 (RA;US)

AIR FILTERS

Contamination
Contamination releases from HEPA filters under high temperature operating conditions, 14:44739 (RA;US)

Decontamination
Design and installation of a radioactive filter leaching system at the Idaho Chemical Processing Plant, 14:44779 (J;US)

Design
Advanced filters for nuclear facilities and filter conditioning for disposal, 14:44752 (RA;US)
Development of a high-efficiency, high-performance air filter medium, 14:44754 (RA;US)
Review of containment vent filter technology, 14:45085 (RA;US)

Efficiency
Effects of temperature and humidity on the aging of TEDA impregnated charcoals, 14:44742 (RA;US)
General correlation of DOP penetration with face velocity as a function of particle size using the FTS-200, 14:46119 (RA;US)
Long-term desorption of CH_3I from a TEDA-impregnated charcoal bed under post-LOCA conditions, 14:45101 (RA;US)
New filter efficiency test for future nuclear grade HEPA filters, 14:44755 (RA;US)
Off-gas cleaning devices for containment venting system, 14:45151 (RA;US)
Prediction of HEPA filter pressure drop and removal efficiency during dust loading, 14:44749 (RA;US)
Study of the performance of charcoal filters under post-LOCA conditions, 14:45096 (RA;US)
Theoretical and experimental investigation on adaptability of charcoal beds to containment filter venting in Italian nuclear power plant, 14:45094 (RA;US)

Evaluation
Effect of age on the structural integrity of HEPA filters, 14:44740 (RA;US)
Study on adsorption characteristics and deterioration patterns of an impregnated active carbon under a simulated service condition of the filtering system at a nuclear power plant, 14:44743 (RA;US)

Fabrication
Structural activated carbon-carbon composition media for fabrication of air and water filters, 14:46082 (RA;US)

Leak Testing
Field test results of in-place charcoal adsorber leak-testing by pulse mode halide injection, 14:44751 (RA;US)

In-place leak test of carbon filters using a pulse injection method, 14:45099 (RA;US)
Methods of testing HEPA filters with short upstream approaches, 14:44756 (RA;US)

Maintenance
Overhead robot system for remote HEPA filter replacement, 14:44781 (J;US)

Optimization
Chemical analysis of new and used 5% TEDA - impregnated carbon, 14:45091 (RA;US)
Introduction of a new generation of high-capacity HEPA filters and a comparison of their performance to HEPA filters available on the market, 14:44747 (RA;US)
Realization of commercial high strength HEPA filters, 14:44748 (RA;US)

Performance Testing
Active charcoal filter ignition tests, 14:44744 (RA;US)
Belgian experience in operation and testing of gasketless charcoal adsorbers, 14:45100 (RA;US)
Development of filter systems injection systems and mixing device evaluation, 14:44757 (RA;US)
In-situ testing of carbon filters at Ontario Hydro's nuclear generating stations, 14:45098 (RA;US)
Measurement and removal of steel flame cutting aerosols (0.01-1 μm) in WAGR decommissioning, 14:45086 (RA;US)
Radioiodine testing of used nuclear grade activated carbon: Penetration results from samples tested with and without moisture equilibration according to a draft revision of ASTM D3803, 14:44750 (RA;US)

AIR FLOW
Calculation of room air flows with CHAMPION SGE-program, 14:45389 (R;FI;In Finnish)

AIR POLLUTION
Acid-precipitation patterns and trends in eastern North America, 1980-1984, 14:46100 (R;US)
Air pollution emission factors. August 1986-July 1989 (Citations from the NTIS data base). Report for August 1986-July 1989, 14:46105 (R;US)
Air-pollution climatology around an isolated point source using convective scaling parameters, 14:46102 (R;US)
Assessing multiple pollutant multiple source cancer risks from urban air toxics: Summary of approaches and insights from completed and ongoing urban air toxics-assessment studies, 14:46099 (R;US)
Atmospheric input of trace substances into the North Sea and the Baltic Sea, 14:46077 (R;DE;In German)
Diffuse discharges of hydrocarbons from the Statoil Bamble petrochemical plant. Measuring method-measures-effects, 14:44502 (RA;NO;In Norwegian)
Fiscal year 1987 summary report of NOAA (National Oceanic and Atmospheric Administration) Meteorology Division support to the environmental protection agency. Technical memo, 14:46097 (R;US)
Influence of weather on pollution levels and deposition in Swedish background air, 14:46078 (R;SE;In Swedish)
Mathematical modeling of cloud chemistry in the California South Coast Air Basin. Final report, August 1987-December 1988, 14:46093 (R;US)
Radiological Sciences Department investigation: Radiation Incident Class 1, No. 536-C, 14:44809 (R;US)
Representativeness of the natural growth of lichens on trees and the death rate for exposed lichens with regard to the action of pollution and to forest damage from pollution, 14:44916 (R;DE;In German)
Studies of the genetic alteration of forest trees due to acid precipitations. Short report, 14:46325 (R;DE;In German)
Studies on air pollution: Effects of nitrogen dioxide on airway caliber and reactivity in asthmatic subjects; effects of nitrogen dioxide on lung lymphocytes and macrophage products in healthy subjects; nasal and bronchial effects of sulfur dioxide in asthmatic subjects. Final report, 26 June 1987-26 November 1988, 14:46327 (R;US)

AIR POLLUTION CONTROL
Gas scrubbers used in pollution control. August 1967-July 1989 (Citations from the COMPENDEX data base). Report for August 1987-July 1989, 14:46104 (R;US)
Preliminary investigations for standardizations of emission measurements of polychlorinated dibenzo-p-dioxins (PCDD) and furans (PCDF). Final report, 14:46107 (R;DE;In German)
Standardization of the emission measurement of polycyclic aromatic hydrocarbons. Final report, 14:46106 (R;DE;In German)
Vehicle emissions testing laboratory, 14:45445 (R;CA;In English and French)

AIR POLLUTION MONITORING
See also AEROSOL MONITORING
Carbonaceous species methods comparison study: University of Minnesota results. Final report, 14:46096 (R;US)
Oil-field emissions of volatile organic compounds. Final report, April 1988-March 1989, 14:44519 (R;US)

Attenuation and cross-attenuation in taste-aversion learning in the rat: Studies with ionizing radiation, lithium chloride, and ethanol. Scientific report, 14:46278 (R;US)
BELLOWS
Piping instability resulting from bellows misalignment, 14:45957 (R;US)
BENTONITE
On the formation of a moving redox-front by α-radiolysis of compacted water saturated bentonite, 14:45729 (R;SE)
BENZENE
Absorption of shocked benzene, 14:45699 (R;US)
Swelling of coal extracts, 14:44432 (R;US)
BENZOPYRENE
Standardization of the emission measurement of polycyclic aromatic hydrocarbons. Final report, 14:46106 (R;DE;In German)
BERING SEA
Environmental atlas of the Bering Sea. Final report, 14:46154 (R;US)
BERKELEY BEVALAC
See BEVALAC
BERYLLIA
See BERYLLIUM OXIDES
BERYLLIUM 8
Symplectic collective model and its submodels, 14:46556 (R;BR;In Portuguese)
BERYLLIUM 9 TARGET
Differential neutron production cross sections and neutron yields from stopping-length targets for 256-MeV protons, 14:46519 (R;US)
BERYLLIUM COMPLEXES
Structural nonrigidity of tetrahedral Zn(2) and Be(2) complexes on the basis of 4-substituted 2,6-diformylphenol diimines, 14:45672 (RA;SU;In Russian)
BERYLLIUM OXIDES
Kinetic analysis of interstitial atomic hydrogen in a-Si:(H,O,N) and beryllia, 14:46601 (R;BR;In Portuguese)
BETA BEAMS (ELECTRONS)
See ELECTRON BEAMS
BETA BEAMS (POSITRONS)
See POSITRON BEAMS
BETATRONS
Review of synchrotron beam stability and stabilizing systems, 14:45979 (J;US)
BEVALAC
A history of central collisions at the Bevalac, 14:45916 (R;US)
BINARY ALLOY SYSTEMS
Electron theory of long wavelength concentration fluctuations in liquid metal alloys, 14:45470 (R;XA)
Magnetic domain structures in cerium-doped $Fe_{80}B_{20}$, $Fe_{80}B_{16}Si_2C_2$ and $Fe_{78}B_{13}Si_9$ glassy ribbons, 14:45510 (BA;US)
BINARY-FLUID SYSTEMS
EPRI [Electric Power Research Institute] geothermal project overview, 14:44959 (RA;US)
Heber Binary Project operating lessons learned, 14:44961 (RA;US)
Heber Binary Project operations and testing status, 14:44960 (RA;US)
The current status of high temperature geothermal lineshaft pump technology, 14:44962 (RA;US)
Validation results for a PC-based binary-cycle geothermal power plant simulator/analyzer, 14:44965 (RA;US)
BINDERS
Test and evaluation of some binders used in ash granulation, 14:44872 (R;SE;In Swedish)
BIODEGRADATION
Anaerobic biodegradation of 2,4-dichlorophenol in freshwater lake sediments at different temperatures, 14:46176 (R;US)
BIOGAS
See METHANE
BIOLOGICAL EVOLUTION
Core evolution: Emergence of cooperative structures in a computational chemistry, 14:46197 (R;US)

BIOLOGICAL INDICATORS
Bioindicators of marine pollution. January 1974-July 1989 (Citations from Oceanic abstracts). Report for January 1974-July 1989, 14:46179 (R;US)
BIOLOGICAL MATERIALS
Amplitude- and phase-contrast x-ray microscopy, 14:46193 (BA;US)
First images from the Stanford tabletop scanning soft x-ray microscope, 14:46191 (BA;US)
X-ray Fourier-transform holographic microscope, 14:46190 (BA;US)
X-ray holography: X-ray interactions and their effects, 14:46194 (BA;US)
X-ray microscopy for the life and physical sciences, 14:45863 (BA;US)
BIOLOGICAL MODELS
[One carbon metabolism in anaerobic bacteria: Regulation of carbon and electron flow during organic acid production]: Progress report, 14:44834 (R;US)
BIOLOGICAL REACTORS
See BIOREACTORS
BIOLOGICAL WARFARE AGENTS
Upper bound on the-threshold crossing probability for short-time exposure dosage with implications for the assessment of hazard from toxic vapors. Memorandum report, 14:46321 (R;CA)
BIOMASS
Bibliography of Finnish biomass and peat literature 1986-1987, 14:44408 (R;FI;In Finnish)
Biofuels, 14:44913 (R;SE;In Swedish)
Combustion of impregnated biomass, 14:45004 (R;NO;In Norwegian)
Compilation of harvesting results from Swedish energy forestry plantations, 14:44909 (R;SE;In Swedish)
Energy forestry fuel for the combined power and heating plant in Lund, 14:44912 (R;SE;In Swedish)
FY 1988 ethanol from biomass annual report, 14:44905 (R;US)
Incineration of household waste with biomass as additive fuel, 14:45429 (R;NO;In Norwegian)
Large scale test South - Energy forestry plantation in southern Scania. Progress report stage 6, 14:44910 (R;SE;In Swedish)
Low-temperature gasification of high-moisture biomass, 14:44900 (R;US)
Preliminary processing of biomass-derived fuels. On-site dual-purpose power plants, 14:44869 (R;DK;In Danish)
Storage and feeding of biomass, 14:45751 (RA;CA)
Wood energy in perspective, 14:45307 (RA;CA)
BIOMASS CONVERSION PLANTS
Community biogas plant Quickborn. Pt. 1 and 2. Pt. 1: Description of the plant and test results. Pt. 2: Development and restoration concept of the pilot project. Final report, 14:44892 (R;DE;In German)
BIOMASS PLANTATIONS
Short-rotation wood energy crops: Presentation notes, 14:44890 (R;US)
BIOREACTORS
A new continuous dynamic immobilized cell fermenter, 14:44851 (RA;CA)
Performance of a novel continuous dynamic immobilized cell bioreactor in ethanolic fermentation, 14:44843 (RA;CA)
BIRDS
Mathematical model for estimation of oil injuries on birds, 14:44523 (R;NO;In Norwegian)
BISMUTH
Spectra of lead, bismuth, thorium and uranium relevent to a neodymium-like soft x-ray lasing scheme, 14:45808 (BA;US)
BISMUTH 209
Gamma decay studies of giant resonances, 14:46536 (BA;US)
BISMUTH COMPOUNDS
See also BISMUTH OXIDES
Temperature dependence of critical current and I-V characteristics in the $YBa_2Cu_3O_7(y)$ and $Bi_2S_2CaCu_2O_8(Bi)$ ceramics, 14:46628 (RA;SU)
Valence, charge transfer, and carrier type for $Ni_2Sr_2Ca_{n-1}CuNO_2(n+4+delta)$ and related high-temperature ceramic superconductors. Professional paper, 14:45519 (R;US)
BISMUTH OXIDES
Interband optical conductivity of $Bi_2CaSr_2Cu_2O_8$, 14:45542 (J;US)
BITTER SPAR
See DOLOMITE
BITUMINOUS COAL
Correlation of slagging/fouling from utility operating data, 14:44452 (RA;US)
Fundamental chemical structure of coal: Final report, 14:44438 (R;US)
BLANKETS (BREEDING)

BOLTED JOINTS
Guidelines for threaded-fastener application in nuclear power plants: Final report, 14:45070 (R;US)
BONE MARROW
Measurement of the radiosensitivity of rat marrow by flow cytometry. Scientific report, 14:46275 (R;US)

BOREHOLES
Downhole pulse radar, 14:44474 (P;US)
Quality loss from seasonal storage of heat in rock, magnitude and evaluation, 14:44946 (RA;CA)
BORON
Trace elements overview, 14:44972 (RA;US)
BORON 12
π^+ photoproduction on ^{12}C nucleus with excitaion of ^{12}B nucleus first level, 14:46516 (RA;SU;In Russian)
BORON ALLOYS
Neutron scattering studies of amorphous Invar alloys, 14:45458 (R;US)
BORON CARBIDES
Characterizations of shock-loaded aluminum-infiltrated boron carbide cermets, 14:45533 (R;US)
Preparation of boron-containing ceramic materials by pyrolysis of the decaborane(14)-derived (-B10H12.Ph_2POPPh2)(x)-polymer. Professional paper, 14:45521 (R;US)
BORON COMPOUNDS
See also BORON CARBIDES
BORON FLUORIDES
CARBORANES
A carboranyl porphyrin for boron neutron capture therapy of brain tumors, 14:46227 (BA;US)
A stochastic model for high-LET response for boron neutron capture therapy (BNCT), 14:46225 (BA;US)
Boron-11 magnetic resonance imaging and spectroscopy; Tools for investigating pharmacokinetics for boron neutron capture therapy, 14:46232 (BA;US)
Distribution of a boronated porphyrin in murine tumors, 14:46228 (BA;US)
Distributions of sulfhydryl borane monomer and dimer in rodents and monomer in humans: Boron neutron capture therapy of melanoma and glioma in boronated rodents, 14:46226 (BA;US)
Neutron capture therapy for melanoma, 14:46230 (BA;US)
Proposed clinical trial studying the pharmacokinetics of B.S.H., 14:46218 (BA;US)
Selective thermal neutron capture therapy and diagnosis of malignant melanoma: From basic studies to first clinical treatment, 14:46233 (BA;US)
Survival assays with a boronated porphyrin as measured with hamster V-79 cells in culture, 14:46229 (BA;US)
Toxicities of $Na_2B_{12}H_{11}SH$ and $Na_4B_{24}H_{22}S_2$ in mice, 14:46238 (BA;US)
Tumor-seeking compounds for boron neutron capture therapy: Synthesis and biodistribution, 14:46231 (BA;US)
Uptake of boron into human gliomas of athymic mice and into syngeneic cerebral gliomas of rats after intracarotid infusion of sulfhydryl boranes, 14:46237 (BA;US)
Use of NMR-NQR on integer spins for nitrogen- and boron containing compound investigation, 14:46607 (RA;SU;In Russian)
BORON FLUORIDES
Phase equilibria in the systems including lithium tetrafluoroborate or hexafluoroarsenate and dipolar aprotic solvents, 14:45638 (RA;SU;In Russian)
Physicochemical properties of electrolytes based on lithium tetrafluoroborate and mixtures of dipolar aprotic solvents with participation of glines, 14:45639 (RA;SU;In Russian)
BOSE-EINSTEIN CONDENSATION
Existence of Bose-Einstein condensation in one and two dimensions, 14:46420 (R;BR)
BOSON EXPANSION
Microscopy of bosonic models using Schwinger and Holstein - Primakoff bosonization techniques, 14:46650 (R;BR;In Portuguese)
BOSONIZATION
See BOSON EXPANSION
BOUNDARY LAYERS

Index to Ontario Petroleum Institue, Inc. Technical vols. 1 to 26, 14:44465 (R;CA)

Renewable Energy Sources
Canadian renewable energy prospects, 14:45306 (R;CA)
Wood energy in perspective, 14:45307 (RA;CA)

Research Programs
Environment Canada Energy Research and Development Programme 1987-88 annual report, 14:45189 (R;CA)
Environmental Studies Research Funds annual report, 1988, 14:45235 (R;CA;In English and French)
Summary of 1983-1985 contract reports of the Energy Research and Development in Agriculture and Food (ERDAF) Program, 14:45398 (R;CA;In English and French)

Small-Scale Hydroelectric Power Plants
Small power production in remote communities. A shared opportunity, 14:44976 (R;CA)

Surface Waters
Acidification of surface waters in eastern Canada and its relationship to aquatic biota, 14:46170 (R;CA;In French)

Transportation Sector
Transportation energy conservation, 14:45391 (R;CA)

Uranium
Comparative study of the US and Canadian uranium industries, 14:44672 (RA;XA)

Uranium Deposits
Conceptual genetic models for important types of uranium deposits and areas favourable for their occurrence in Canada, 14:44627 (RA;XA)

Uranium Reserves
Analysis of uranium discovery in Canada, 1930-1983: Rates of discovery, exploration expenditures, discovery costs and geological deposit types, 14:44626 (RA;XA)

CANADIAN ORGANIZATIONS
National Energy Board, 1987-88 estimates. Part 3, expenditure plan, 14:45222 (R;CA;In English and French)
National Energy Board, 1989-90 estimates. Part 3, expenditure plan, 14:45223 (R;CA;In English and French)
Northern Pipeline Agency Canada, 1987-88 estimates. Part 3, expenditure plan, 14:45225 (R;CA;In English and French)

CANCER
See NEOPLASMS

CANDIDA
Ethanol and sugar tolerance of candida shehatae, 14:44846 (RA;CA)

CANDU TYPE REACTORS
See also POINT LEPREAU-1 REACTOR
Air oxidation of UO_2 fuel. Chalk River studies, 14:45045 (R;CA)
Comparison of calculated and experimental values of In/Mn and Lu/Mn ratios in CANDU-type lattices, 14:45049 (R;CA)
Description of the blowdown test facility COG program on in-reactor fission product release, transport, and deposition under severe accident conditions, 14:45111 (R;CA)
Transport mechanisms of uranium released to the coolant from fuel defects, 14:45048 (R;CA)

CAPACITORS
Mechanical states in wound capacitors: Part 1, Prediction, 14:45868 (R;US)
Mechanical states in wound capacitors: Part 2, Optimization, 14:45566 (R;US)

CAPACITY
The TE-POT-model. The effects of an incentives policy and low fuel prices on small scale cogeneration potential, 14:45172 (R;NL;In (In Dutch))

CAPILLARY FLOW
Capillary effects in steady-state flow in heterogeneous cores, 14:44480 (R;US)

CAPTURE
Measured dependence of effective cross-sections on thermal neutron temperature, 14:46510 (RA;XA)

CARBENES
Synthesis and structures of bimetallic titanium and chromium carbene complexes of the type $Cp_2Ti(Cl)O(CH_3)CCr(CO)_5$, 14:45709 (J;US)

CARBINOL
See METHANOL

CARBOHYDRATES
Radioiodinated branched carbohydrates, 14:46205 (P;US)

CARBON
See also ACTIVATED CARBON
DIAMONDS
GRAPHITE
Carbonaceous species methods comparison study: University of Minnesota results. Final report, 14:46096 (R;US)
Chemical analysis of new and used 5% TEDA - impregnated carbon, 14:45091 (RA;US)

Differential neutron production cross sections and neutron yields from stopping-length targets for 256-MeV protons, 14:46519 (R;US)
Mathematical models of temperature programmed desorption of oxygen complexes from porous chars and carbons, 14:44441 (J;US)
Measurements of carbon thin films using x-ray reflectivity, 14:45580 (J;US)
Summary of presentations and discussions with special reference to the need of intercomparison and reference materials in analytical chemistry related to silicon electronics, 14:45593 (RA;XA)
Theoretical description of the graphite, diamond, and liquid phases of carbon, 14:45576 (J;US)

CARBON 12 REACTIONS
Nuclear structure effects in elastic ^{12}C + ^{12}C scattering, 14:46518 (R;DE)
Studies of elastic scattering and cross sections of the ^{12}C + ^{28}Si system, 14:46521 (R;BR;In Portuguese)

CARBON 12 TARGET
π^+ photoproduction on ^{12}C nucleus with excitaion of ^{12}B nucleus first level, 14:46516 (RA;SU;In Russian)
Elastic break-up of 156 MeV ^{6}Li projectiles with large asymptotic relative momenta of the fragments, 14:46517 (R;DE)
Nuclear structure effects in elastic ^{12}C + ^{12}C scattering, 14:46518 (R;DE)

CARBON 14
The diffusion of $^{14}CO_2$ through engineered barrier media, 14:44695 (RA;US)

CARBON DIOXIDE
Assessment of crop response to increases in atmospheric carbon dioxide concentrations: Summary of research progress report, July 1, 1988–June 30, 1989, 14:46073 (R;US)
CO_2-reduction potential through rational energy utilization and use of renewable energy sources in the Federal Republic of Germany, 14:46079 (R;DE)
Carbon dioxide from flue gases for enhanced oil recovery, 14:45399 (R;US)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 1, 14:44475 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 4. Procedure of technical CO_2 at substantial lower costs compared to pure CO_2, 14:44478 (R;DE;In German)
Strategic high-altitude atmospheric radiation code (SHARC) user instructions. Technical report, September 1987-January 1989, 14:46057 (R;US)

CARBON DIOXIDE INJECTION
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 3. Numerical simulation, 14:44477 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 4. Procedure of technical CO_2 at substantial lower costs compared to pure CO_2, 14:44478 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 3. Numerical simulation, 14:44477 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 1, 14:44475 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2 - experimental investigations. Final report. Pt. 2, 14:44476 (R;DE;In German)
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2. Final report. Pt. 1, 14:44475 (R;DE;In German)
Gas miscible displacement enhanced oil recovery: Technology status report, 14:44481 (R;US)

CARBON DIOXIDE LASERS
Laser ignition of oil spills. Telescope assembly and testing, 14:44511 (R;CA)

CARBON IONS
Measurement of the quenching of spontaneous emission coefficients in laser-produced plasmas, 14:46399 (BA;US)

CARBON MONOXIDE
Inhalation toxicology. 9. Times-to-incapacitation for rats exposed to carbon monoxide alone, to hydrogen cyanide along, and to mixtures of carbon monoxide and hydrogen cyanide. Technical report, January-November 1986, 14:46322 (R;US)
Real-time, on-line determination of carbon monoxide using charge exchange with krypton in a triple quadrupole mass spectrometer, 14:44623 (J;US)
Strategic high-altitude atmospheric radiation code (SHARC) user instructions. Technical report, September 1987-January 1989, 14:46057 (R;US)

CARBON STEELS
See also STEEL-ASTM-A516
STEEL-ASTM-A533-B
Effects of seasonal variations on requirements to prevent corrosion in soils: Final report, 14:44611 (R;US)
Microstructural effects on spall fracture in 1008 steel, 14:45485 (R;US)

CARBONYLS
Equilibria within the $Ru_3(CO)_{12}$/halide system, 14:44859 (J;US)
Ketone-like derivatization reactions of metal carbonyls. Attempts to measure the equilibrium constant for ketalization of a carbonyl ligand in $[Re(CO)_6]^+$ by ethylene glycol, 14:45706 (J;US)
Kinetic and thermodynamic stabilities of the geometric isomers of $(R_3P)_2Ru(CO)_2Cl_2$ and $(R_3P)_3Ru(CO)Cl_2$ complexes, 14:45712 (J;US)
Valence electronic structure of bis(pyrazolyl)-bridged iridium dicarbonyl dimers. Electronic effects of 3,5-dimethylpyrazolyl substitution on metal-metal interactions, 14:45717 (J;US)

CARBORANES
Preparation of boron-containing ceramic materials by pyrolysis of the decaborane(14)-derived (-B10H12.Ph_2POPPh2)(x)-polymer. Professional paper, 14:45521 (R;US)

CARBOXYLIC ACID SALTS
See also ACETATES
Concurrent and reversible changes of color and of phase in an aqueous solution of the (2,6-pyridinedicarboxylato)chloroplatinate(II) complex. Spectroscopic and crystallographic studies of the discrete monomer and evidence of a stacked polymer, 14:45715 (J;US)

CARBOXYLIC ACIDS
Experimental study of fats and fatty acids labelled with I-131 in lung tissue, 14:46301 (RA;SU;In Russian)

CARCINOGENESIS
Experimental radiobiology and radiation protection studies, 14:46285 (R;US)

CARCINOGENS
Assessing multiple pollutant multiple source cancer risks from urban air toxics: Summary of approaches and insights from completed and ongoing urban air toxics-assessment studies, 14:46099 (R;US)

CARCINOMAS
Polyradionuclide diagnosis of lung neoplasm, 14:46267 (RA;SU;In Russian)

CARRIERS
Membrane-based thin layer SOFC components, 14:45316 (R;NL)

CASCADE IMPACTORS
New inertial and diffusional device (SDI 2000), 14:46113 (RA;FR)
Virtual cascade impactors for the collection of radioactive atmospheric aerosols, 14:46112 (RA;FR)

CASINGS (WELL)
See WELL CASINGS

CASTING
Thin section casting program: Volume 1, Executive summary and overview: Final report, 14:45461 (R;US)

Thin section casting program: Volume 5, Westinghouse MHD Project: Final report, 14:45466 (R;US)

CATALYSTS
Catalytic oxidation of tritium and tritiated hydrocarbons in air and argon and adsorption of tritiated water on type 3A molecular sieves, 14:46118 (RA;US)
Literature review on catalytic conversion of methane to C_2-hydrocarbons: Technical note, 14:44835 (R;US)
Method for the preparation of novel polyacetylene-type polymers, 14:45719 (P;US)
Role of free radicals in hydroprocessing of coal liquids, 14:44442 (J;US)
The influence of manganese leached from plants on dew chemistry, 14:46074 (R;NL)

CATHODES
Conductive $LiFe(Mg)O_2$ ceramics for molten carbonate fuel cells, 14:45315 (R;NL)
Membrane-based thin layer SOFC components, 14:45316 (R;NL)

CATION EXCHANGE CAPACITY
See ION EXCHANGE

CAVITIES
See also BOREHOLES
ROCK CAVERNS
SALT CAVERNS
Development of the steel/aluminum composite gate for the modified auxiliary closure, 14:45501 (R;US)
Mapping of central depressions, 14:45887 (RA;NO;In Norwegian)
Quality loss from seasonal storage of heat in rock, magnitude and evaluation, 14:44946 (RA;CA)

CAVITY RESONATORS
Effectiveness of metal-coated diffraction gratings at grazing and near normal incidence as harmonic scrubbers, 14:45828 (BA;US)
Introduction to wakefields and wake potentials, 14:45922 (BA;US)

CDF
Radiation measurements inside the CDF detector, 14:45992 (R;US)

CDTE SEMICONDUCTOR DETECTORS
Proceedings of the polycrystalline thin film program meeting, 14:44904 (R;US)

CELL NUCLEI
Cytogenetic analysis by in situ hybridization with fluorescently labeled nucleic acid probes, 14:46207 (BA;US)

CELLOBIOSE
Fermentation of cellobiose and wood sugars to ethanol by candida shehatae and pichia stripitis, 14:44855 (RA;CA)
Recent advances in xylose and cellobiose fermentation, 14:44841 (RA;CA)

CELLULOSE
Ultrapyrolysis of cellulose and wood components, 14:44917 (R;CA)

CEMENTS
Fly ash and silica fume chemistry and hydration, 14:44440 (BA;GB)

CENTRAL HEATING PLANTS
Fuel handling systems for wood-fired heating plants, 14:45877 (RA;CA)

CENTRAL NERVOUS SYSTEM
See also BRAIN
Delayed effects of neutron irradiation on central nervous system microvasculature in the rate, 14:46282 (BA;US)
Status report on the development of a spallation neutron source for neutron capture therapy (NCT), 14:46236 (BA;US)

CENTRAL RECEIVER TEST FACILITY
Thermal nuclear blast simulation at the National Solar Thermal Test Facility, 14:44920 (R;US)

Chemical Reactions
Coal thermolysis modeling: The effects of restricted diffusion on thermal reaction pathways, 14:44431 (R;US)
Combustion
Experimental studies on group ignition of a cloud of coal particles: Quarterly progress report No. 3, March 16, 1989–May 15, 1989, 14:44451 (R;US)
Harwell coal combustion programme. Second annual report on a research programme funded by The Department of Energy, 14:44457 (R;GB)
Predictive experience of CCRL tunnel furnace for powdered coal firing, 14:45876 (R;CA)
Combustion Kinetics
The fate of coal ash: The effect of coal combustion mechanism, 14:44455 (RA;US)
Devolatilization
The fate of mineral matter during pulverized coal combustion, 14:44456 (RA;US)
Distribution
Coal distribution, January–March 1989, 14:45232 (R;US)
Flotation
Evaluation of reverse coal-pyrite flotation for a proposed Ohio advanced coal-cleaning test facility, 14:44413 (R;US)
Grinding
Pitt Mill demonstration: Quarterly technical progress report, April–June 1989, 14:44411 (R;US)
Pitt Mill demonstration: Quarterly technical progress report, January–March 1989, 14:44410 (R;US)
Imports
Cost comparison of selected US and Australian coal mines, 14:44461 (R;US)
Meetings
Public meetings for views and comments on the conduct of the 1989 Clean Coal Technology Solicitation: Denver, Colorado, January 18, 1989; Irving, Texas, February 2, 1989; and Atlanta, Georgia, February 16, 1989: Summary proceedings, 14:45234 (R;US)
Molecular Structure
Influence of organic coal structure on liquefaction behavior under low-severity conditions, 14:44429 (R;US)
Nmr Spectra
A solid-state NMR study of condensation/retrograde reactions during coal liquefaction: Quarterly progress report for the period April 1, 1989–June 30, 1989, 14:44420 (R;US)
Pixe Analysis
Nigerian coal analysis by PIXE and HEBS techniques, 14:45594 (R;XA)
Production
Quarterly coal report, January–March 1989, 14:45231 (R;US)
Pulverized Fuels
Bench-scale studies to identify process parameters controlling reburning with pulverized coal. Final report, January 1980-December 1983, 14:44445 (R;US)
Quantitative Chemical Analysis
Real-time, on-line determination of carbon monoxide using charge exchange with krypton in a triple quadrupole mass spectrometer, 14:44623 (J;US)
Research Programs
Harwell coal combustion programme. Second annual report on a research programme funded by The Department of Energy, 14:44457 (R;GB)
Separation Processes
Ash separation by induced electrical properties of low rank coal: Final report, 14:44409 (R;US)
Surface Properties
Chemical characterization of the surface sites of coal: Progress report, December 15, 1988–March 14, 1989, 14:44433 (R;US)
Trade
Comments on coal and related issues, 14:45227 (RA;US)
COAL EXTRACTS
Swelling of coal extracts, 14:44432 (R;US)
COAL GASIFICATION
A 32-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized-bed gasification system: Quarterly technical progress report, July–September 1987, 14:44418 (R;US)
A 32-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized-bed gasification system: Quarterly technical progress report, April to June 1987, 14:44417 (R;US)
A 50-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized-bed gasification system: Annual technical progress report, September 1987–September 1988, 14:44419 (R;US)
Importance of active sites for char gasification in oxygen (air) and carbon dioxide. Final report, October 1982-September 1987, 14:44426 (R;US)
COAL INDUSTRY
Quarterly coal report, January–March 1989, 14:45231 (R;US)
COAL LIQUEFACTION
Activation of hydrous titanium oxide-supported catalysts for HYD [hydrogenation], HDS [hydrodesulfurization], and HDO [hydrodeoxygenation] reactions, 14:44428 (R;US)
Development of a methodology for a comparative techno-economic analysis of coal liquefaction, coprocessing and resid upgrading, 14:44430 (R;US)
Influence of organic coal structure on liquefaction behavior under low-severity conditions, 14:44429 (R;US)
Novel supports for coal liquefaction catalysts: Quarterly report No. 3, March 1, 1989–May 31, 1989, 14:44422 (R;US)
Studies of the initial reactions that occur during direct coal liquefaction, 14:44427 (R;US)
COAL LIQUIDS
Characterization and upgrading of coal liquids derived from mild gasification processes, 14:44415 (R;US)
Hydrogen bonding in coal liquids and coal liquid distillates: Final report for the study period, October 1985–May 1989: Part 4, 14:44437 (R;US)
Hydrogen bonding in coal liquids and coal liquid distillates: Final report for the study period, October 1985–May 1989: Part 2, 14:44435 (R;US)
Hydrogen bonding in coal liquids and coal liquid distillates: Final report for the study period, October 1985–May 1989, 14:44436 (R;US)
Hydrogen bonding in coal liquids and coal liquid distillates: Final report for the study period, October 1985–May 1989: Part 4, 14:44437 (R;US)
Hydrogen bonding in coal liquids and coal liquid distillates: Final report for the study period, October 1985–May 1989, 14:44434 (R;US)
Hydrogen bonding in coal liquids and coal liquid distillates: Final report for the study period, October 1985–May 1989: Part 2, 14:44435 (R;US)
Hydrogen bonding in coal liquids and coal liquid distillates: Final report for the study period, October 1985–May 1989, 14:44436 (R;US)
Role of free radicals in hydroprocessing of coal liquids, 14:44442 (J;US)
COAL MINES
Calamity Hollow Mine Fire Project. (In five parts). 2: Operation of the burnout control system. Report of Investigations/1989, 14:44447 (R;US)
Cost comparison of selected US and Australian coal mines, 14:44461 (R;US)
COAL-DERIVED LIQUIDS

Shock-induced atomic-scale structure in metals, 14:45499 (R;US)
Steel impurity element effects on postirradiation properties recovery by annealing: Final report, 14:45491 (R;US)
Studies of hot, solid materials produced by an ultrashort pulse laser, 14:46579 (BA;US)

COPPER ALLOYS
Interim evaluation of the thermal stability of $Cu_{0.67}Y_{0.25}Kr_{0.08}$ sputter deposits, 14:44753 (RA;US)
The quantitative analysis of fracture surfaces using fractals, 14:45457 (R;US)

COPPER COMPLEXES
Ligand-substitution and electron-transfer reactions of pentacoordinate copper (I) complexes, 14:45700 (J;US)
Structural, optical, and redox properties of lamellar solids derived from copper(1) complexes and n-butylammonium uranyl phosphate and arsenate. Technical report, 14:45583 (R;US)

COPPER COMPOUNDS
See also COPPER OXIDES
CUPRATES
Preparation and characterization of members of the system La(2-x)A(1+x) Cu_2O (+ or - y) where A = Ca,Sr. Technical report, 14:45518 (R;US)
Synthesis, ESR studies, band electronic structure, and superconductivity in the $(BEDT\text{-}TTF)_2M(NCS)_2$ system (M = Cu, Ag, Au), 14:45577 (J;US)
Valence, charge transfer, and carrier type for $Ni_2Sr_2Ca_{n-1}CuNO_2$(n+4+delta) and related high-temperature ceramic superconductors. Professional paper, 14:45519 (R;US)

COPPER OXIDES
A study of the tribological and surface micromechanical properties of $YBa_2Cu_3O_{7-x}$: Final report, 14:45538 (R;US)
Adaptation of the theory of superconductivity to the behavior of oxides, 14:46630 (R;US)
Changes in physical properties of the high-T_c superconductor Y-Ba-Cu-O due to Cu deficiency, 14:45544 (J;US)
Defect structures preceding amorphization by ion irradiations in $YBa_2Cu_3O_{7-\delta}$, 14:45522 (R;US)
Direct evidence of anomalous Cu-O vibrational modes near T_c in $ErBa_2Cu_3O_{7-\delta}$, 14:45549 (J;US)
Interband optical conductivity of $Bi_2CaSr_2Cu_2O_8$, 14:45542 (J;US)
Intergranular and interphase boundaries in ceramics, 14:45534 (R;US)
Magnetic properties of the superconducting "superoxide" $La_2CuO_{4+\delta}$, 14:45548 (J;US)
Preparation of superconducting thick films of $YBa_2Cu_3O_7$ by deposition of a superconducting precursor ink, 14:45545 (J;US)
Temperature dependence of the magnetic excitations in $La_{1.85}Sr_{0.15}CuO_4$ (T_c=33 K), 14:45543 (J;US)

COPPER SELENIDE SOLAR CELLS
Novel thin-film $CuInSe_2$ fabrication: Final subcontract report, January 1989, 14:44906 (R;US)
Proceedings of the polycrystalline thin film program meeting, 14:44904 (R;US)

COPPER SULFIDE SOLAR CELLS
Research and development into new technologies associated with low cost thin film solar cells, 14:44893 (R;CA)

COPPER VAPOR LASERS
See GAS LASERS

COPRECIPITATION
Demonstration of technologies to remove contamination from groundwater, 14:44771 (R;US)

COPROCESSING
Development of a methodology for a comparative techno-economic analysis of coal liquefaction, coprocessing and resid upgrading, 14:44430 (R;US)

CORES (DRILL)
See DRILL CORES

CORES (REACTOR)
See REACTOR CORES

CORN STOVER
See AGRICULTURAL WASTES

CORNELL ELECTRON-POSITRON STORAGE RING
See CESR STORAGE RING

CORONA (SOLAR)
See SOLAR CORONA

CORROSION
Techniques to reduce fireside corrosion and fly ash erosion, 14:44454 (RA;US)
CORROSION PRODUCTS
Techniques for the identification of corrosion products, 14:45530 (R;BR;In Portuguese)
COSMIC DUST
Photoabsorption and photodissociation of molecules important in the interstellar medium. Annual report, 15 January 1988-14 January 1989, 14:46377 (R;US)
COSMIC PARTICLES
See COSMIC RADIATION
COSMIC RADIATION
Quantization by cosmic-background radiation. Technical report, 14:46633 (R;US)
COSMIC X-RAY SOURCES
MOXE: An x-ray all-sky monitor for Soviet Spectrum-X-Gamma Mission, 14:46374 (R;US)
COSMOLOGICAL MODELS
Cosmological model with Einstein - De Sitter metric and closed spatial section, 14:46369 (R;BR;In Portuguese)
Study of primitive universe in the Bianchi IX model, 14:46371 (R;BR;In Portuguese)
COSO HOT SPRINGS
Coso update, 14:44957 (RA;US)
COST BENEFIT ANALYSIS
A practical method of performing cost-benefit analysis of occupational and environmental protective measures, 14:46316 (R;US)
COUNTERS (RADIATION)
See RADIATION DETECTORS
COUNTING TECHNIQUES
Simulation calculations on the measurement of electroweak processes in the ZEUS experiment, 14:46446 (R;DE;In German)
COUPLED CHANNEL THEORY
Low-energy heavy-ion reactions: Some recent developments, 14:46540 (R;US)
CP INVARIANCE
CP-violation in SUSY, 14:46459 (RA;JP)
Phenomenology of spontaneous CP violation model with neutral flavor conservation, 14:46468 (RA;JP)
CRACK GROWTH
See CRACK PROPAGATION
CRACK PROPAGATION
Fractal dimension of the fractured surface of materials, 14:46592 (R;XA)
CRACKING
2000-hour stress-corrosion cracking tests on 90-10 cupronickel in simulated Hanford groundwater, 14:44724 (R;US)
CREEKS
See STREAMS
CREEP
Characterization of pore evolution in ceramics during creep failure and densification: Progress report, 14:45524 (R;US)
CRITICALITY ACCIDENTS
See RADIATION ACCIDENTS
CRUDE OIL
See PETROLEUM
CRYOGENIC FLUIDS
Analysis of the nonvented fill of a 4.96-cubic-meter lightweight liquid hydrogen tank, 14:45761 (R;US)
Performance of all-metal demountable cryogenic seals at superfluid helium temperatures, 14:45762 (R;US)
CRYOGENICS
Heat-transfer and friction factor design data for all-metal compact heat exchangers. Summary report, January 1985-November 1987, 14:45748 (R;US)
CRYOGENS
See CRYOGENIC FLUIDS
CRYOSTATS
SSC superconducting dipole magnet cryostat model style B construction experience, 14:45956 (R;US)
CRYSTAL DEFECTS
Pairs of chalcogen impurities in silicon, 14:46595 (R;BR;In Portuguese)
CRYSTALS
Coherent excitations of nuclei in crystals by synchrotron radiation pulses, 14:46576 (BA;US)
Crystal orientation effects in PETN explosive with 4 GPa shocks, 14:46031 (R;US)
CULTURAL OBJECTS
PIXE analysis of museum soapstone sculptures from Esie, south west Nigeria, 14:45595 (R;XA)
CULTURAL RESOURCES
Hanford cultural resources management plan, 14:45177 (R;US)
CUPRATES
Magnetization of $YBa_2Cu_3O_{7-x}$ ceramics after irradiation with carbon relativistic nuclei, 14:46626 (RA;SU;In Russian)
Preparation and characterization of members of the system La(2-x)A(1+x) Cu_2O (+ or - y) where A = Ca,Sr. Technical report, 14:45518 (R;US)
Stabilization of high-temperature superconductor $Y_1Ba_2Cu_3O_{7-\delta}$ surface, 14:46627 (RA;SU)
Temperature dependence of critical current and I-V characteristics in the $YBa_2Cu_3O_7$(y) and $Bi_2S_2CaCu_2O_8$(Bi) ceramics, 14:46628 (RA;SU)
Theoretical study of ultrasonic anomalies in $La_{2-x}Sr_xCuO_4$, 14:46625 (RA;SU)
Transient Josephson effect on Y-Ba-Cu-O film at T=4.2 K, 14:46624 (RA;SU;In Russian)
Valence, charge transfer, and carrier type for $Ni_2Sr_2Ca_{n-1}CuNO_2$(n+4+delta) and related high-temperature ceramic superconductors. Professional paper, 14:45519 (R;US)
CUTTING FLUIDS
Cutting fluid performance testing: Tapping torque test, 14:45482 (R;US)
CUTTING TOOLS
Dismantling of JPDR reactor internals by underwater plasma arc cutting technique using robotic manipulator, 14:44815 (RA;US)
Particle size of fuel chips made by landing chippers, 14:44874 (R;FI;In Finnish)
CYANIDES
See also HYDROCYANIC ACID
Synthesis of the new organic metal $(ET)_2C(CN)_3$ characterization of its metal-insulator phase transition at ≈ 180 K, 14:45701 (J;US)
X-ray diffraction patterns of metal aurocyanides, 14:45571 (R;US)
CYCLASES
Glycation of calmodulin: Chemistry and structural and functional consequences, 14:46213 (J;US)
CYCLIC ACCELERATORS
See also BETATRONS
BEVALAC
SYNCHROTRONS
Longitudinal phase space in circular accelerators, 14:45908 (BA;US)
RF system considerations for a large hadron collider, 14:45939 (BA;US)
Transverse motion of single particles in accelerators, 14:45919 (BA;US)
CYCLONE SEPARATORS
Development of a multi-tube axial flow cyclone separator system for use in nuclear gas cleaning systems, 14:45087 (RA;US)
CYLINDRICAL CONFIGURATION
Heat transfer and fluid dynamics of concave-surface curvature. Final report, 1 January 1986-31 December 1988, 14:45839 (R;US)
CZECHOSLOVAKIA
BNCT project in Czechoslovakia, 14:46217 (BA;US)

D

D MESONS
An experimental review of the decays of the D_S meson, 14:46439 (R;US)
Monte Carlo study of CP asymmetry measurement of a Tau-Charm Factory, 14:46442 (R;US)
Unsolved problems in hadronic charm decay, 14:46481 (R;US)
V_{cd} and V_{cs} from current models, 14:46479 (R;US)

FARLEY-2 REACTOR
Field studies on intergranular attack: Final report, 14:45038 (R;US)

FARMS
Consumption of electricity on farms and means of eliminating consumption peaks, 14:45302 (R;FI;In Finnish)

FAST NEUTRONS
Fast neutron detection using a new pulse shape discrimination technique: Charge sensitive integration, 14:46007 (BA;US)
Nuclear data for structural materials of fission and fusion reactors. Summary of the second research coordination meeting on methods for the calculation of fast neutron data for structural materials held in Vienna, 15-17 February 1988, 14:46553 (R;XA)

FATTY ACIDS
See CARBOXYLIC ACIDS

FAULT TOLERANT COMPUTERS
Strategic Defense System distributed operating system R & D (research and development) review and recommendations. Final report, 14:46786 (R;US)

FEDERAL BUILDINGS
Environmental monitoring for EG and G Idaho facilities at at the Idaho National Engineering Laboratory: Annual report, 1988, 14:46122 (R;US)
Work plan radiological assessment of the Laboratory for Energy-Related Health Research, 14:46315 (R;US)

FEDERAL REPUBLIC OF GERMANY
Chernobyl - what can natural scientists or physicians say to that accident?. Brief lectures, 14:46299 (R;DE;In German)
Community biogas plant Quickborn. Pt. 1 and 2. Pt. 1: Description of the plant and test results. Pt. 2: Development and restoration concept of the pilot project. Final report, 14:44892 (R;DE;In German)
Role of electricity in the future energy system in the Federal Republic of Germany (FRG), 14:45290 (RA;SE)

Treatment, conditioning and packaging of low and medium level radioactive wastes at the Karlsruhe Nuclear Research Center, 14:44685 (RA;US)

FEED MATERIALS PLANTS
See also FEED MATERIALS PRODUCTION CENTER
Waste assessment radiological characterization of the Weldon Spring Site raffinate pits, 14:44805 (R;US)

FEED MATERIALS PRODUCTION CENTER
Technical Safety Appraisal of the Feed Materials Production Center, Westinghouse Materials Company of Ohio, 14:45114 (R;US)

FERMENTATION ALCOHOL
See ETHANOL

FERMILAB TEVATRON
Antiproton source, 14:45950 (BA;US)
Beam loss, 14:45910 (BA;US)
Design and operation of the quench protection system for the Fermilab tevatron, 14:45952 (BA;US)
Emittance through the Fermilab accelerator chain, 14:45907 (BA;US)
Introduction, 14:45906 (BA;US)
Longitudinal instabilities and stability criteria, 14:45909 (BA;US)
Resonant extraction at the tevatron, 14:45951 (BA;US)

FERMIONS
See also BARYONS
QUARKS
Quantum consistency of a gauge-invariant theory of a massive spin-3/2 particle interacting with external fields, 14:46638 (R;XA)

FERRITES
A 50-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized-bed gasification system: Annual technical progress report, September 1987–September 1988, 14:44419 (R;US)

FERRITIC STEELS
A method for determining the crack arrest fracture toughness of ferritic materials, 14:45515 (BA;US)
Environmentally assisted cracking in light water reactors: Semi-annual report, October 1987–March 1988, 14:45025 (R;US)

FERROMAGNETIC MATERIALS
Eddy current inspection of ferromagnetic materials using pulsed magnetic saturation, 14:44997 (BA;US)

FIBER OPTICS
Fiber optics: A brief introduction, 14:46016 (R;US)
Multimode fiber interferometry and several-mode fiber polarimetry via phase conjugation, 14:46019 (R;US)
Research planning study of fiber-optic sensors: Final report, 14:44990 (R;US)

FIELD PRODUCTION EQUIPMENT
Measurement of the sea-bed settling over the oil and gas deposits in the North Sea by means of the GPS (Global Positioning System), 14:44503 (RA;NO;In Norwegian)

FIELD TESTS
Wind-tunnel study of atmospheric dispersion of exhausts from the NDERF building stack, 14:46108 (R;US)
Wind-tunnel study of atmospheric dispersion of exhausts from the stack of building 222, 14:46109 (R;US)

FIELD THEORIES
See also QUANTUM FIELD THEORY
Modular transformations of conformal blocks in WZW models on Riemann surfaces of higher genus, 14:46495 (R;XA)
Three level constraints on conformal field theories and string models, 14:46505 (R;US)

Air-pollution climatology around an isolated point source using convective scaling parameters, 14:46102 (R;US)
Boiler tube failure: Correction, prevention, and control: Final report, 14:44991 (R;US)
Carbon dioxide from flue gases for enhanced oil recovery, 14:45399 (R;US)
Cost and quality of fuels for electric utility plants 1988, 14:45237 (R;US)
Developing an austenitic stainless steel for improved performance in advanced fossil power facilities, 14:45517 (J;US)
Hatching and early rearing of salmon and trout in warm water from a power plant, 14:44993 (R;CA)
Model boiler cost analysis for controlling nitrogen oxides (NOx) emissions from small-steam generating units. Final report, 14:45002 (R;US)
Overview of the regulatory baseline, technical basis, and alternative control levels for nitrogen oxides (NOx) emission standards for small steam generating units. Final report, 14:45001 (R;US)
Projected impacts of alternative new source performance standards for small industrial-commercial-institutional fossil fuel-fired boilers. Final report Final report, 14:45003 (R;US)

FOUR WAVE MIXING
See FREQUENCY MIXING

FOURIER TRANSFORMATION
Computing the two dimensional fast Fourier transform on a general purpose mesh connected multiprocessor, 14:46773 (R;US)

FRACTOGRAPHY
A technique to correlate fractography with NDE [nondestructive evaluation] of small samples, 14:45856 (R;US)

FRANCE
French energy policy: A privileged place for electricity, 14:45291 (RA;SE)
Similarities and differences between unconformity-spatially related uranium deposits from Aveyron, France, and Saskatchewan, Canada, 14:44644 (RA;XA)

FREE CONVECTION
See NATURAL CONVECTION

FREE ELECTRON LASERS
A compact x-ray free electron laser, 14:45784 (R;US)
Annual report to the Strategic Defense Initiative organization on the free-electron laser driven by the NIST c-w microtron. Annual report, 1 April 1988-31 March 1989, 14:46784 (R;US)
Coherence and statistical properties of photon beams with application to the free-electron laser, 14:45949 (BA;US)
Compact x-ray free-electron laser, 14:45822 (BA;US)
Current prospects for free-electron lasers in the extreme ultraviolet, 14:45821 (BA;US)
Effectiveness of metal-coated diffraction gratings at grazing and near normal incidence as harmonic scrubbers, 14:45828 (BA;US)
Free-electron lasers, 14:45946 (BA;US)
Free-electron lasers, 14:45947 (BA;US)
Induction accelerators and free-electron lasers at LLNL, 14:45911 (BA;US)
Los Alamos High-Brightness Accelerator FEL (HIBAF) facility, 14:45834 (R;US)
Reflectance of aluminum reflectors in the extreme ultraviolet, 14:45827 (BA;US)
[Synchrotron radiation, free electron laser, and nuclear structure]: Foreign trip report, April 6, 1989–April 13, 1989, 14:45835 (R;US)

FREE RADICALS
See RADICALS

FREQUENCY CONVERTERS
25 Hz system load measurements. Hamilton Gage TS [transformer station], 14:45014 (R;CA)

FREQUENCY MIXING
See also HARMONIC GENERATION
Quantum-mechanical interference in four-wave mixing, 14:45806 (BA;US)

FRESH WATER ECOSYSTEMS
See AQUATIC ECOSYSTEMS

FRESNEL LENS
Diffraction contrast of a Bragg-Fresnel lens in white and monochromatic radiation, 14:46635 (BA;US)
Soft x-ray lenses with 400 Å outer zone width, 14:46195 (BA;US)

FUCOSE
See HEXOSES

FUEL ADDITIVES
Additive response and the effect of the chemical composition on storage stability of diesel fuels, 14:44589 (BA;GB)
Biocides for microbiological contamination control in naval distillate fuel, 14:44545 (BA;GB)
Chemistry of antioxidant additive depletion in jet fuels, 14:44557 (BA;GB)
Combustion of impregnated biomass, 14:45004 (R;NO;In Norwegian)
Field trials illustrating the long term effectiveness of methylisothiazolones in the preservation of liquid fuels, 14:44594 (BA;GB)
Solid absorbents as distillate fuel stability agents, 14:44566 (BA;GB)
Storage stability changes with commercially available diesel fuel winterizing additives in the United States, 14:44567 (BA;GB)
Studies of fuel deterioration and additive-inhibition mechanisms, 14:44574 (BA;GB)
Studies on a U.S. Military approved fuel preservative and stabilizer, 14:44540 (BA;GB)
Use of BNPD to control microbial growth in diesel fuel systems, 14:44542 (BA;GB)

FUEL ASSEMBLY DISMANTLING
Hot fuel examination facility-north fuel element puncturing and gas sampling system, 14:45158 (J;US)
Overview of the prototypical rod consolidation program, 14:44777 (J;US)

FUEL CANS
AMPTRACT: an algebraic model for computing pressure tube circumferential and steam temperature transients under stratified channel coolant conditions., 14:45109 (R;CA)
ELESTRES: performance of nuclear fuel, circumferential ridging, and multiaxial elastic-plastic stresses in sheaths, 14:45046 (R;CA)

FUEL CELLS
See also ACID ELECTROLYTE FUEL CELLS
HYDROGEN FUEL CELLS
SOLID ELECTROLYTE FUEL CELLS
Manifold, bus support and coupling arrangement for solid oxide fuel cells, 14:45319 (P;US)
Method and apparatus for assembling solid oxide fuel cells, 14:45318 (P;US)

FUEL COOLING INSTALLATIONS
See SPENT FUEL STORAGE

FUEL CYCLE CENTERS
Occupational radiation exposure at commercial nuclear power reactors and other facilities 1986: Nineteenth annual report, 14:45137 (R;US)

FUEL ELEMENT FAILURE
Transport mechanisms of uranium released to the coolant from fuel defects, 14:45048 (R;CA)

FUEL FEEDING SYSTEMS
Storage and feeding of biomass, 14:45751 (RA;CA)

FUEL MANAGEMENT
Advances in uranium enrichment processes. A challenge to innovation, 14:44671 (R;CA)

FUEL OILS
See also HEATING OILS
Biodegradation of stored heavy fuel oil with production of methane in unlined rock caverns, 14:44539 (BA;GB)
Effects of storage on the stability of residual fuel oil, 14:44536 (BA;GB)
Examination of fuel deposits from various sources by pyrolysis/field ionization mass spectrometry, 14:44573 (BA;GB)
Influence of lubricating oils on the colloidal stability reserve of residual fuel oils, 14:44537 (BA;GB)
NO_x emission characteristics of industrial burners and control methods under oxygen enriched combustion conditions, 14:45875 (R;US)
Prediction of storage stability and compatibility of residual fuel oils, 14:44534 (BA;GB)
Residual fuel oil stability and compatibility studies, 14:44533 (BA;GB)

FUEL PELLETS
ELESTRES: performance of nuclear fuel, circumferential ridging, and multiaxial elastic-plastic stresses in sheaths, 14:45046 (R;CA)

FUEL PLATES
High density fuel plates by hot isostatic pressing, 14:45077 (R;US)

FUEL REPROCESSING PLANTS
See also IDAHO CHEMICAL PROCESSING PLANT
WEST VALLEY PROCESSING PLANT
Concepts and operating results of minimizing radioactive emissions for the Wackersdorf reprocessing plant, 14:44666 (RA;US)

FUEL ROD CONSOLIDATION
See FUEL RODS

FUEL RODS
Rating of element closure welds and its influence on fuel reliability, 14:45047 (R;CA)

FUEL SHEATHS
See FUEL CANS

FUEL SLUGS
See FUEL RODS

FUEL SLURRIES
Development and characterization of transparent slurries for basic and applied research in solids transport, 14:44449 (R;US)

FUEL SUBSTITUTION
Financing options for energy projects, 14:45308 (RA;CA)
Interfuel substitution analysis: an integrated planning approach to comparing the benefits and costs of fuel switching, 14:45254 (RA;US)
Solid fuel combustion at Hammarstrand and Stugun, and LPG combustion at Hammarstrand, 14:44873 (R;SE;In Swedish)

FUEL SUSPENSIONS
See FUEL SLURRIES

FUEL-COOLANT INTERACTIONS
Steam explosion studies with molten iron-alumina generated by thermite reactions, 14:45078 (R;US)

FUELS
See also AUTOMOTIVE FUELS
AVIATION FUELS
FOSSIL FUELS
FUEL SLURRIES
JET ENGINE FUELS
LIQUID FUELS
NUCLEAR FUELS
REFUSE DERIVED FUELS
SOLID FUELS
WOOD FUELS
Cost and quality of fuels for electric utility plants 1988, 14:45237 (R;US)

FUELS (NUCLEAR)
See NUCLEAR FUELS

FUELWOOD
See WOOD FUELS

FUMES
See AEROSOLS

FUNCTIONAL ANALYSIS
Flow of harmonic applications of a compact variety on a bordered variety, 14:46646 (R;XA;In French)

FURANS
See also TETRAHYDROFURAN
Preliminary investigations for standardizations of emission measurements of polychlorinated dibenzo-p-dioxins (PCDD) and furans (PCDF). Final report, 14:46107 (R;DE;In German)

FURNACE OIL
See HEATING OILS

FURNACES
See also GAS FURNACES
WOOD BURNING FURNACES
Apparatus having inductively coupled coaxial coils for measuring buildup of slag or ash in a furnace, 14:45878 (P;US)
The magnetohydrodynamics coal-fired flow facility: Technical progress report, January 1, 1989–March 31, 1989, 14:45312 (R;US)

FUSED SALTS
See MOLTEN SALTS

FUSION (NUCLEAR)
See THERMONUCLEAR REACTIONS

FUSION ENERGY
See THERMONUCLEAR REACTORS

FUSION REACTIONS
See HEAVY ION FUSION REACTIONS

FUSION REACTORS
See THERMONUCLEAR REACTORS

G

GADOLINIUM 148
Nuclear shapes from charged-particle γ-ray angular correlations, 14:46530 (BA;US)

GADOLINIUM COMPLEXES
ODMR in 2 ero field-new approch to coordination compound photoexcited states, 14:46606 (RA;SU;In Russian)

PMR determination of Gd(3) ferromagnetic ions in the presence of ethylenediaminetetraacetic acid, 14:45619 (RA;SU;In Russian)

GALAXIES
Study of invisible axions in the galaxy, 14:46372 (RA;JP)

GALAXY NUCLEI
Model of a black hole gas submitted to background gravitational field for active galaxy nuclei with application to calculating the continuous emission spectra of massless particles (Photons: neutrinos and gravitons), 14:46370 (R;BR;In Portuguese)

GALERKIN-PETROV METHOD
Feed back Petrov-Galerkin methods for convection dominated problems, 14:45850 (R;BR)

GALLIUM
Ion beam annealing of Ga-implanted Si, 14:45456 (R;US)

GALLIUM 67
^{67}Ga and ^{111}In buildup in neoplasms depending on chemical factors, 14:46300 (RA;SU;In Russian)
Combined radionuclide examinations in diagnosis of lung carcinoma, 14:46263 (RA;SU;In Russian)

GALLIUM ANTIMONIDES
Surface rotational phonons on the cleavage faces of tetrahedrally coordinated compound semiconductors, 14:45578 (J;US)

GALLIUM ARSENIDE SOLAR CELLS
A V-grooved GaAs solar cell, 14:44896 (R;US)
The NASA Space Solar Cell Advanced Research Program, 14:44897 (R;US)

GALLIUM ARSENIDES
Characterization of GaAs/Si/GaAs heterointerfaces, 14:45490 (R;US)
Methods to decrease defect density in GaAs/Si heteroepitaxy, 14:45489 (R;US)
Surface rotational phonons on the cleavage faces of tetrahedrally coordinated compound semiconductors, 14:45578 (J;US)
Temperature dependence of (100) GaAs and InAs surface structure transitions, 14:45478 (RA;SU;In Russian)

GALLIUM PHOSPHIDES
Surface rotational phonons on the cleavage faces of tetrahedrally coordinated compound semiconductors, 14:45578 (J;US)

GAMMA REACTIONS
See PHOTONUCLEAR REACTIONS

GAMMA SPECTROMETERS
Observational techniques for solar flare gamma-rays, hard X-rays, and neutrons. Final report, 1 November 1983-30 November 1988, 14:46001 (R;US)

GAMMA-RAY LASERS
See GASERS

GANIL
See GANIL CYCLOTRON

GANIL CYCLOTRON
Observation of new neutron rich nuclei ^{29}F, ^{35}Mg, ^{36}Mg, ^{38}Al, ^{39}Al, ^{40}Si, ^{41}Si, ^{43}P, ^{44}P, ^{45}S, ^{47}S, ^{46}Cl, ^{49}Cl and ^{49}Ar, ^{51}Ar from the intera, 14:46532 (R;FR)

GAS ANALYSIS
Analytical instrument with apparatus for sample concentrating, 14:44617 (P;US)

GAS BURNERS
Advanced refinery process heater. Final report, (October 1983-September 1988), 14:44500 (R;US)

GAS COOLANTS
See GASES

GAS ENGINES
See INTERNAL COMBUSTION ENGINES

GAS FURNACES
Ceramic-tube material and processing development: development of slip-cast and extruded-reaction-bonded silicon carbide components for gas-fired furnaces. Final report, February 1982-October 1987, 14:44618 (R;US)

GAS GENERATORS
Development of analytical methodology for biomass gasification products, 14:44915 (R;CA)

GAS INJECTION
Miscible displacement yearly report 1988, 14:44483 (R;NO)
Simulation of miscible gas displacement with a finite element compositional simulator, 14:44482 (R;DK)

GAS LASERS
See also CARBON DIOXIDE LASERS
EXCIMER LASERS
METAL VAPOR LASERS
Observation of extreme ultraviolet amplification in 3-2 (42~46Å), 4-3 (130.5Å) and 5-4 (305Å) transitions in laser produced He-like Al plasma, 14:45786 (BA;US)

GAS METAL-ARC WELDING
Method for controlling gas metal arc welding, 14:45873 (P;US)

GAS OILS
Investigation of sediment precursors present in cracked gas oil, 14:44571 (BA;GB)
Measurement of low levels of strong acids in gas oils, 14:44577 (BA;GB)
Stability measurements of military and commercial marine fuels from a worldwide survey, 14:44568 (BA;GB)
Study of stability of diesel fuels under operational conditions, 14:44579 (BA;GB)
Synthesis of sediment precursor compounds and simulation of sediment formation in cracked gas oil using model systems, 14:44572 (BA;GB)

GAS TURBINE ENGINES
Advanced Gas Turbine (AGT) Technology Project: Final report, 14:45437 (R;US)
Advanced Turbine Technology Applications Program, (ATTAP): A plan for improving the prototype production of ceramic components for the gas turbine engine, 1988–1992, 14:45435 (R;US)
Advanced turbine technology applications program, (ATTAP): An overview of complementary activities on ceramic materials within the Allied-Signal Corporation and the General Motors Corporation which provide synergistic benefits to the ATTAP program, 1988–1992, 14:45436 (R;US)
Fuel flow measurement in gas turbine testing, 14:46022 (R;CA)
Production processes of ceramic turbine wheels suitable for a car gas turbine. Final report, 14:45440 (R;DE;In German)

GAS UTILITIES
Interfuel substitution analysis: an integrated planning approach to comparing the benefits and costs of fuel switching, 14:45254 (RA;US)

GAS WELLS
See NATURAL GAS WELLS

GAS-INSULATED TRANSFORMERS
Toronto Cecil TS [transformer station] GIS [gas insulated substation] /cable interface arresters power frequency overvoltages and energy rating, 14:45011 (R;CA)
Toronto Cecil TS. [generating station] Grounding system tests, 14:45016 (R;CA)

GASERS
Proof of the feasibility of coherent and incoherent schemes for pumping a gamma-ray laser. Quarterly technical progress report, 1 January-31 March 1989, 14:46538 (R;US)
SDIO/IST ultrashort-wavelength laser: Novel experimental schemes for observing the Moessbauer effect in long-lived nuclear levels and nuclear coherent states. Rept. No. 2, for 27 May 1988-27 February 1989, 14:45783 (R;US)

GASES
See also AIR
EXHAUST GASES
RARE GASES
Conditions of radiation in large boilers and furnaces. Ribbon radiation models, 14:45743 (R;DK;In Danish)
Transport in simple dense fluids, 14:45702 (J;US)

GASOHOL
Stability properties of gasoline - alcohol blends, 14:44560 (BA;GB)

GASOLINE
Evaluation of motor gasoline stability, 14:44561 (BA;GB)
Storage stability of aviation gasoline, 14:44562 (BA;GB)

GASOLINE ENGINES
See INTERNAL COMBUSTION ENGINES

GE SEMICONDUCTOR DETECTORS
See also LI-DRIFTED GE DETECTORS

Observational techniques for solar flare gamma-rays, hard X-rays, and neutrons. Final report, 1 November 1983-30 November 1988, 14:46001 (R;US)

GE(LI) DETECTORS
See LI-DRIFTED GE DETECTORS

GEARS
Effects of lubrication on the performance of high speed spur gears, 14:45764 (R;US)

GELS
Electrophoretic extraction of proteins from two-dimensional electrophoresis gel spots, 14:46206 (P;US)
Neural networks and the human genome project, 14:46202 (R;US)

GENE LOCI
See GENES

GENE RECOMBINATION PROTEINS
Identification of DNA repair genes in the human genome, 14:46199 (BA;US)

GENERATING CAPACITY
See CAPACITY

GENERATORS (ELECTRIC)
See ELECTRIC GENERATORS

GENERATORS (PULSE)
See PULSE GENERATORS

GENES
Mapping the human genome, 14:46204 (R;US)
Neural networks and the human genome project, 14:46202 (R;US)

GENETIC MAPPING
Application of synthetic DNA probes to the analysis of DNA sequence variants in man, 14:46208 (BA;US)

GENETIC VARIABILITY
Application of synthetic DNA probes to the analysis of DNA sequence variants in man, 14:46208 (BA;US)

GEOLOGIC FORMATIONS
Nonparametric approach for localized stochastic model of rock joint systems, 14:44675 (BA;US)

GEOLOGIC SURVEYS
MUCK - a novel approach to co-kriging, 14:46341 (BA;US)

KLYSTRONS
An immersed field cluster klystron, 14:45964 (R;US)

KNOCK-ON ELECTRONS
See ELECTRONS

KOBAYASHI-MASKAWA MATRIX
Phenomenology of the CKM [Cabibbo-Kobayashi-Maskawa] matrix, 14:46480 (R;US)

KRYPTON
Radioactive noble gas adsorption and irradiation studies, 14:45095 (RA;US)
Symmetries and asymmetries in above-threshold ionization, 14:46394 (BA;US)
Ultra-high resolution VUV-XUV laser: Application to the hyperfine study of krypton, 14:46400 (BA;US)

KRYPTON 85
Interim evaluation of the thermal stability of $Cu_{0.67}Y_{0.25}Kr_{0.08}$ sputter deposits, 14:44753 (RA;US)
Newly designed anticoincidence proportional counter for measuring ^{85}Kr in environmental air samples, 14:46002 (RA;US)
KRYPTON 86 TARGET
Neutron cross section measurements using the Oak Ridge electron linear accelerator: Performance report, July 1988–July 1989, 14:46525 (R;US)
KRYPTON FLUORIDE LASERS
Multiterawatt excimer laser system, 14:45816 (BA;US)
KRYPTON FLUORIDES
Time-resolved flourescence measurements of KrF emission produced by vacuum ultraviolet photolysis of KrF_2 mixtures, 14:45725 (R;US)
KUOSHENG-1 REACTOR
Analysis of the MSIV closure ATWS in a BWR/6, 14:45160 (J;US)
RETRAN02/MOD3 modeling of the Kuosheng Unit 1 MSIV full isolation startup test, 14:45032 (J;US)
KURCHATOVIUM
See ELEMENT 104

L

L-2 STELLARATOR
Plasma production and heating by an ordinary wave in a stellarator in the ECR heating regime, 14:46684 (RA;SU;In Russian)
LA REINA REACTOR
See RESEARCH REACTORS
LABELLED COMPOUNDS
See also RADIOPHARMACEUTICALS
Mercuric acetate phenyl maleimide useful for preparing radiohalogenated maleimides, 14:45740 (P;US)
Synthesis of radiolabeled chemical agents/precursors. Final summary report, 1 March 1984-30 September 1986, 14:45730 (R;US)
LABORATORIES
A review of the requirements for accreditation of the analytical services section laboratory, 14:45623 (R;CA)
[Study of the behavioral and biological effects of high intensity 60 Hz electric fields]: Quarterly technical progress report No. 29, 14:46338 (R;US)
LAGRANGE FIELD EQUATIONS
See LAGRANGIAN FIELD THEORY
LAGRANGIAN FIELD THEORY
Gauge-invariant formulation of stochastic quantized nonabelian theory. Counterterm dependence on gauge, 14:46502 (RA;SU;In Russian)
LAKES
See also GREAT LAKES
Acid sensitivity of lakes in Ontario, 14:46160 (R;CA;In English and French)
Adirondack lake system acidity: Differences between headwater and nonheadwater lakes, 14:46159 (RA;NO)
Ecological aspects of lake regulation in Northern Finland. Part 1. General results, 14:44881 (R;FI;In Finnish)
Effects of acid precipitation on a boreal forest ecosystem. Ion budgets and changes in water chemistry for the Laflamme Lake watershed, 14:46168 (R;CA)
Macrophyte data from 46 southern Ontario soft-water lakes of varying pH, 14:46161 (R;CA)
LAMINAR FLOW
Laminar forced convection inside externally finned tubes, 14:45845 (R;BR)
LAND APPLICATION
See GROUND DISPOSAL
LAND FILLS
See SANITARY LANDFILLS
LAND POLLUTION
Superfund Record of Decision (EPA Region 7): Fulbright/Sac River Landfill, Missouri (first remedial action), September 1988. Final report, 14:46153 (R;US)
LANDAU-GINZBURG-PITAEVSKII THEORY
See GINZBURG-PITAEVSKII THEORY
LANDFILLS
See SANITARY LANDFILLS
LANTHANIDES
See RARE EARTHS
LANTHANUM
Membrane-based thin layer SOFC components, 14:45316 (R;NL)
LANTHANUM CHROMITES
See LANTHANUM OXIDES
LANTHANUM COMPLEXES
^{1}H and ^{13}C NMR study of structure and stability of heteroligand complexes formed by certain rare earths with chelating agents, derivatives of dicarboxylic acids, and citric acid, 14:45650 (RA;SU;In Russian)
LANTHANUM COMPOUNDS
See also LANTHANUM OXIDES
LANTHANUM TUNGSTATES
Preparation and characterization of members of the system La(2-x)A(1+x) Cu_2O (+ or - y) where A = Ca,Sr. Technical report, 14:45518 (R;US)
LANTHANUM OXIDES
Magnetic properties of the superconducting "superoxide" $La_2CuO_{4+\delta}$, 14:45548 (J;US)
Temperature dependence of the magnetic excitations in $La_{1.85}Sr_{0.15}CuO_4$ (T_c=33 K), 14:45543 (J;US)
Theoretical study of ultrasonic anomalies in $La_{2-x}Sr_xCuO_4$, 14:46625 (RA;SU)
LANTHANUM TUNGSTATES
PMR in the study of structure and thermal stability of group 3 element paratungstates, 14:45657 (RA;SU;In Russian)
LASER FUSION REACTORS
Cr^{3+}-doped colquiriite solid state laser material, 14:46734 (P;US)
LASER ISOTOPE SEPARATION
Heterodyne laser spectroscopy system, 14:45718 (P;US)
LASER MATERIALS
Cr^{3+}-doped colquiriite solid state laser material, 14:46734 (P;US)
Gain measurement on a 18.2-nm carbon recombination laser produced by an intense CO_2 laser, 14:45811 (BA;US)
Multiphoton ionization for the production of x-ray laser plasmas, 14:45825 (BA;US)
Synthetic laser medium, 14:45581 (P;US)
LASER MIRRORS
Reflectance of aluminum reflectors in the extreme ultraviolet, 14:45827 (BA;US)
LASER RADIATION
Continuous anti-Stokes Raman laser operation, 14:45802 (BA;US)
Gain guided x-ray beams, 14:45798 (BA;US)
Narrowband tunable VUV/XUV radiation generated by frequency mixing of pulsed and cw laser radiation, 14:45817 (BA;US)
Preliminary model of the distribution of laser-induced retinal lesions resulting from eye and head responses. Interim report, Julu 1987-January 1988, 14:46336 (R;US)
Stimulated Compton backscattering and the high intensity Kapitza-Dirac effect, 14:46434 (BA;US)
Transient visual effects of prolonged small spot foveal laser exposure. Report for January-March 1989, 14:46337 (R;US)
LASER SPECTROSCOPY
Heterodyne laser spectroscopy system, 14:45718 (P;US)
LASER TARGETS
Low-density carbonized composite foams for direct-drive laser ICF targets, 14:46725 (R;US)
LASER WEAPONS
XRLSim model specifications and user interfaces, 14:46789 (R;US)
LASER-PRODUCED PLASMA
Amplification and gain measurement of extreme ultraviolet radiation (42.4Å, 45Å and 46Å) in He-like Al laser plasma, 14:45794 (BA;US)
Characteristics of a non-equilibrium picosecond laser plasma, 14:46668 (BA;US)

Experimental and numerical studies of laser-sustained gas plasmas. Final report, 1 February 1988-15 March 1989, 14:46701 (R;US)
Observations of high density plasmas produced with a picosecond high power KrF laser, 14:46667 (BA;US)
Population inversions between n=5, 4, 3 and 2 levels of He-like Al plasma observed by spatially resolved X-ray spectroscopy, 14:45795 (BA;US)
Probability of soft x-ray radiation for 3p-3s transition in neon-like iron, 14:45796 (BA;US)
Targets for efficient femtosecond-time-scale x-ray generation, 14:45823 (BA;US)
X-ray emission studies of sub-picosecond laser produced plasmas, 14:45820 (BA;US)

LASERS
See also FREE ELECTRON LASERS
GAS LASERS
SOLID STATE LASERS
X-RAY LASERS
Amplification and gain measurement of extreme ultraviolet radiation (42.4Å, 45Å and 46Å) in He-like Al laser plasma, 14:45794 (BA;US)
Amplification in Na XI Hα, Mg XII Hα and Al XIII Hα transitions, 14:45791 (BA;US)
CO_2 laser-heated plasmas for electron-collisionally pumped XUV laser studies, 14:45799 (BA;US)
Capillary discharge plasmas as extreme ultraviolet laser sources, 14:45801 (BA;US)
Characteristics of a non-equilibrium picosecond laser plasma, 14:46668 (BA;US)
Coplanar vacuum photodiode for measurement of short-wavelength picosecond pulses, 14:45830 (BA;US)
Gain measurement on a 18.2-nm carbon recombination laser produced by an intense CO_2 laser, 14:45811 (BA;US)
High efficiency, scalable, 130 nm coherent source by four-wave mixing in Hg vapor, 14:45818 (BA;US)
High power, short pulse ultra-violet laser for the development of a new x-ray laser, 14:45803 (BA;US)
Multiphoton ionization for the production of x-ray laser plasmas, 14:45825 (BA;US)
Non-reciprocity of autoionizing interferences: Lasers without inversion, 14:45832 (BA;US)
Population inversion through charge exchange process in plasmas, 14:45792 (BA;US)
Population inversions between n=5, 4, 3 and 2 levels of He-like Al plasma observed by spatially resolved X-ray spectroscopy, 14:45795 (BA;US)
Prepulsing to increase the efficiency of laser-produced plasma pumped lasers, 14:45793 (BA;US)
Synthetic laser medium, 14:45581 (P;US)
Transversely optically pumped ultraviolet laser in the range of 330-390 nm, 14:45807 (BA;US)
Ultrahigh peak power pulses produced by Chirped Pulse Amplification, 14:45815 (BA;US)
VUV amplification of neon-like titanium ion, 14:45813 (BA;US)

LATTICE DEFECTS
See CRYSTAL DEFECTS

LATTICE FIELD THEORY
Lattice fields and strong interactions, 14:46488 (R;US)
Quantization of anomalous gauge theories on a lattice, 14:46486 (R;US)

LAWRENCE LIVERMORE LABORATORY
Energy Program annual report, 1988, 14:45201 (R;US)

LEACHATES
Biological treatment of leachate from a Superfund site, 14:46142 (R;US)

LEAD
Differential neutron production cross sections and neutron yields from stopping-length targets for 256-MeV protons, 14:46519 (R;US)
Effects of heavy metals in sediments on the macroinvertebrate community in the Short Creek/Empire Lake aquatic system, Cherokee County, Kansas: A recommendation for site-specific criteria. Technical report (Final), 14:46328 (R;US)
Experimental measurements of shock-induced vaporization in cadmium and lead, 14:45497 (R;US)
Spectra of lead, bismuth, thorium and uranium relevent to a neodymium-like soft x-ray lasing scheme, 14:45808 (BA;US)
The inhibiting effect of calcium at higher pollutant burdens, 14:46324 (R;DE;In German)

LEAD 206
Lead and uranium isotopes in groundwaters around the Cigar Lake uranium deposit (Saskatchewan, Canada): Preliminary results, 14:44650 (RA;XA)

LEAD 208
Gamma decay studies of giant resonances, 14:46536 (BA;US)
Giant resonances: Progress, new directions, new challenges, 14:46541 (R;US)

LEAD 208 TARGET
A prior-form distorted wave Born approximation analysis of the elastic break-up of 156 MeV ^{6}Li projectiles, 14:46558 (R;DE)
Elastic break-up of 156 MeV ^{6}Li projectiles with large asymptotic relative momenta of the fragments, 14:46517 (R;DE)
Neutron cross section measurements using the Oak Ridge electron linear accelerator: Performance report, July 1988–July 1989, 14:46525 (R;US)
Transfer reactions with heavy deformed nuclei, 14:46537 (BA;US)

LEAD 210
^{137}Cs radioactive dating of lake core sediments, 14:46360 (BA;US)
Gamma-ray methodology for the determination of lead-210 in mineralogical materials, 14:45622 (R;CA)
Radionuclide tracers for the fate of metals in the Savannah estuary: River-ocean exchange processes, 14:46182 (R;US)

LEAD ALLOYS
Fiber tower calorimeter continuation proposal and status report, 14:46015 (R;US)

LEAD ORES
Capsule report: Environmental controls at a secondary lead smelter, 14:46098 (R;US)

LEGUMINOSAE
Effect of gamma irradiation on the physicochemical and cooking characteristics of chickpea, 14:46298 (R;PK)

LEPTON-DEUTERON INTERACTIONS
See DEUTERIUM TARGET

LET
A stochastic model for high-LET response for boron neutron capture therapy (BNCT), 14:46225 (BA;US)

LI-DRIFTED GE DETECTORS
Least square methods and covariance matrix applied to the relative efficiency calibration of a Ge(Li) detector, 14:45999 (R;BR)

LICHENS
Representativeness of the natural growth of lichens on trees and the death rate for exposed lichens with regard to the action of pollution and to forest damage from pollution, 14:44916 (R;DE;In German)

LIE SUPERALGEBRA
See GRADED LIE GROUPS

LIGHT NUCLEI

Neutron Capture Therapy
A carboranyl porphyrin for boron neutron capture therapy of brain tumors, 14:46227 (BA;US)
A proposed protocol for clinical trials of boron neutron capture therapy in glioblastoma multiforme, 14:46224 (BA;US)
A stochastic model for high-LET response for boron neutron capture therapy (BNCT), 14:46225 (BA;US)
Blood-brain-barrier impairment after irradiation: Implication in boron neutron capture therapy, 14:46234 (BA;US)
Implications of genotypic and microenvironmental heterogeneity for the cure of solid tumors by neutron capture therapy, 14:46235 (BA;US)
Status report on the development of a spallation neutron source for neutron capture therapy (NCT), 14:46236 (BA;US)
The effect of ionizing radiation on the blood-brain-barrier (BBB): Considerations for the application of boron neutron capture therapy (BNCT) of brain tumors, 14:46283 (BA;US)
Tumor-seeking compounds for boron neutron capture therapy: Synthesis and biodistribution, 14:46231 (BA;US)
Vascular factors affecting drug delivery to brain tumors, 14:46223 (BA;US)

RadioImmunoassay
Combined radionuclide examinations in diagnosis of lung carcinoma, 14:46263 (RA;SU;In Russian)
Complex in vivo - in vitro examination in case of mammary gland neoplasm, 14:46266 (RA;SU;In Russian)

RadioInduction
Experimental radiobiology and radiation protection studies, 14:46285 (R;US)
The health risks of radon: The BEIR IV report and beyond, 14:46309 (R;US)

Radiopharmaceuticals
Intra-arterial injection of radioactive microspheres in neoplasm treatment, 14:46306 (RA;SU;In Russian)
Radiopharmaceuticals in oncology. Collection of scientific papers, 14:45736 (R;SU;In Russian)

Risk Assessment
Assessing multiple pollutant multiple source cancer risks from urban air toxics: Summary of approaches and insights from completed and ongoing urban air toxics-assessment studies, 14:46099 (R;US)

Scintiscanning
^{111}In-citrine in clinical oncology, 14:46265 (RA;SU;In Russian)
Combined radionuclide examinations in diagnosis of lung carcinoma, 14:46263 (RA;SU;In Russian)
Complex in vivo - in vitro examination in case of mammary gland neoplasm, 14:46266 (RA;SU;In Russian)
Experience of positive scintigraphy of neoplasms of various localization, 14:46262 (RA;SU;In Russian)
Osteoscintigraphy in clinical practice, 14:46261 (RA;SU;In Russian)
Positive scintigraphy with ^{67}Ga- and ^{111}In-bleomycin in diagnosis of neoplasms of peritoneal and retroperitoneal space, 14:46264 (RA;SU;In Russian)
Radionuclide diagnosis of bone system injuries in children, 14:46260 (RA;SU;In Russian)

NEPA
See NATIONAL ENVIRONMENTAL POLICY ACT

NEPTUNYL COMPOUNDS
Intercalation reactions of the neptunyl(vi) dication with hydrogen uranyl phosphate and hydrogen neptunyl phosphate host lattices. Technical report, 14:45582 (R;US)

NET TOKAMAK
Investigations of in-vessel handling concepts for NET, 14:46710 (RA;XA)
Maintenance concepts for NET, 14:46707 (RA;XA)
Nuclear Fusion Project. Semi-annual report of the Association KfK/EURATOM. October 1988 - March 1989, 14:46715 (R;DE)

NETWORK ANALYSIS
Contribution to the optimal synthesis of heat exchanger networks: computer programs proposition, 14:45412 (R;FR;In French)

NETWORKS (COMPUTER)

Neutrino physics: Summary talk, 14:46445 (R;US)

NEUTRON BEAMS
Fractionation in boron neutron capture therapy, 14:46219 (BA;US)

NEUTRON CAPTURE
See CAPTURE
NEUTRON REACTIONS

NEUTRON CAPTURE THERAPY
A proposed protocol for clinical trials of boron neutron capture therapy in glioblastoma multiforme, 14:46224 (BA;US)
BNCT and dose fractionation, 14:46222 (BA;US)
BNCT project in Czechoslovakia, 14:46217 (BA;US)
Blood-brain-barrier impairment after irradiation: Implication in boron neutron capture therapy, 14:46234 (BA;US)
Delayed effects of neutron irradiation on central nervous system microvasculature in the rate, 14:46282 (BA;US)
Dose fractionation in neutron capture therapy for malignant melanoma, 14:46220 (BA;US)
Fractionation considerations for boron neutron capture therapy: The perspective of a clinician, 14:46214 (BA;US)
Fractionation in boron neutron capture therapy, 14:46219 (BA;US)
PBF/BNCT Program for cancer treatment: Bulletin, 14:46288 (R;US)
PBF/BNCT [Power Burst Facility/Boron Neutron Capture Therapy] program for cancer treatment: Volume 3, No. 3, 14:46287 (R;US)
Pharmacokinetics of cesium mercaptoundehydrododecaborate compound for neutron-capture therapy, 14:46307 (RA;SU;In Russian)
Research on neutron capture therapy in the USSR, 14:46216 (BA;US)
Status report on the development of a spallation neutron source for neutron capture therapy (NCT), 14:46236 (BA;US)
The effect of ionizing radiation on the blood-brain-barrier (BBB): Considerations for the application of boron neutron capture therapy (BNCT) of brain tumors, 14:46283 (BA;US)
Thermal neutron capture therapy: The Japanese-Australian clinical trial for malignant melanoma, 14:46221 (BA;US)
Vascular factors affecting drug delivery to brain tumors, 14:46223 (BA;US)

NEUTRON DETECTORS
Calibration of neutron detectors at the ORNL Advanced Toroidal Facility, 14:46669 (R;US)
Response functions of a BC501 scintillation detector for neutrons up to 41 MeV. Final report, March 1985-December 1987, 14:45980 (R;US)

NEUTRON MATTER
See NUCLEAR MATTER

NEUTRON REACTIONS
See also THERMAL FISSION
Doppler broadening effects in low energy resonances, 14:45065 (RA;XA)
Nuclear data for structural materials of fission and fusion reactors. Summary of the second research coordination meeting on methods for the calculation of fast neutron data for structural materials held in Vienna, 15-17 February 1988, 14:46553 (R;XA)
Statistical multistep reactions: application, 14:46552 (R;XA)
URR [Unresolved Resonance Region] computer code: A code to calculate resonance neutron cross-section probability tables, Bondarenko self-shielding factors, and self-indication ratios for fissile and fertile nuclides, 14:46565 (R;US)
Updated users' guide for SAMMY: Multilevel R-matrix fits to neutron data using Bayes' equation: Revision 2, 14:46564 (R;US)

NEUTRON SOURCE FACILITIES
Accuracy of transport calculations for the advanced neutron source, 14:45108 (J;US)
Research opportunities and planned facilities at the advanced neutron source, 14:45107 (J;US)

NEUTRON SOURCES
Advanced neutron source final preconceptual reference core design, 14:44831 (R;US)
Proceedings of the 10th meeting of the international collaboration on advanced neutron sources, 14:44830 (R;US)
Proceedings of the Japan-U.S. workshop P-119 on 14 MeV neutron source for material R and D based on plasma devices, 14:46714 (R;JP)
Switchable radioactive neutron source device, 14:44832 (P;US)
The reversed-field-pinch (RFP) fusion neutron source: A conceptual design, 14:46716 (R;US)

NEUTRON TRANSPORT
Solution of Milne problem by Laplace transformation with numerical inversion, 14:46571 (R;BR;In Portuguese)

NEUTRON TRANSPORT THEORY
Generalized subgroup approach to calculating resonance absorption of neutrons in nuclear reactors, 14:45062 (RA;XA)

NEUTRON-RICH ISOTOPES
Observation of new neutron rich nuclei ^{29}F, ^{35}Mg, ^{36}Mg, ^{38}Al, ^{39}Al, ^{40}Si, ^{41}Si, ^{43}P, ^{44}P, ^{45}S, ^{47}S, ^{46}Cl, ^{49}Cl and ^{49}Ar, ^{51}Ar from the intera, 14:46532 (R;FR)

NEUTRONS
See also EPITHERMAL NEUTRONS
FAST NEUTRONS
Calculated inclusive neutron production from 400 GeV proton-nucleus collisions, 14:46474 (R;US)

NEVADA
Northern Nevada's geothermal power plants, 14:44958 (RA;US)

NEW BRUNSWICK
Current activity in wood chip combustion systems in the Atlantic region, 14:44868 (RA;CA)
Energy Educators of New Brunswick annual report, 1987-1988, 14:45433 (R;CA)
Forest management implications of wood energy, 14:45309 (RA;CA)
Survey of public attitudes towards energy conservation, 14:45432 (R;CA)
Survey of public attitudes towards energy conservation. Research recommendations, 14:45431 (R;CA)
The socio-economic impact of wood energy use in the province of New Brunswick, 14:45176 (RA;CA)
Wood: a fuel for the future in New Brunswick, 14:44863 (RA;CA)

NEW JERSEY
Groundwater extraction and disposal program to control off-site migration of soluble petroleum hydrocarbons, 14:46752 (RA;US)

NEW MEXICO
Stable-isotope investigation of vapor transport during groundwater recharge in New Mexico. Technical completion report, 14:46186 (R;US)

NEW YORK
West Valley New York Decontamination Project, 14:44702 (RA;US)

NEWFOUNDLAND
Current activity in wood chip combustion systems in the Atlantic region, 14:44868 (RA;CA)
Newfoundland and Labrador Hydro annual report, 1988, 14:45296 (R;CA)

NEWTON MECHANICS
See CLASSICAL MECHANICS

NEXT EUROPEAN TORUS
See NET TOKAMAK

NICKEL
Activation of hydrous titanium oxide-supported catalysts for HYD [hydrogenation], HDS [hydrodesulfurization], and HDO [hydrodeoxygenation] reactions, 14:44428 (R;US)
Studies of the initial reactions that occur during direct coal liquefaction, 14:44427 (R;US)
Study of electric resistivity in function of temperature in $Ni_2Mn(Sn_{1-x}\ In_x)$ type Heuster alloys, 14:45471 (R;BR;In Portuguese)

NICKEL 58 TARGET
Coupled-channels calculations of elastic and inelastic scattering, 14:46570 (J;US)

NICKEL ALLOYS
See also CHROMIUM-NICKEL STEELS
INVAR
Characterization of inhomogeneities in amorphous superconductors, 14:45509 (BA;US)
Evidence for the formation of a metastable crystalline phase during crystallization of Zr-Ni metallic glasses of approximately 57-63.2 at. % Zr*, 14:45507 (BA;US)
Plasma deposition of amorphous metal alloys, 14:46614 (BA;US)

NICKEL COMPOUNDS
Reactions of disubstituted alkanes with a nickel(I) macrocycle, 14:45710 (J;US)

NICKEL-HYDROGEN BATTERIES
Lightweight fibrous nickel electrodes for nickel-hydrogen batteries, 14:45164 (R;US)

NIOBIUM
Hydrogen adsorption at Nb(100): Photoemission evidence of two-stage exchange involving subsurface states, 14:46387 (R;US)
Multiple-scattering Green-function method for space-filling cell potentials, 14:46619 (J;US)

NIOBIUM 93 REACTIONS
The role of the viscosity in the hydrodynamic model of high-energetic heavy ion reactions, 14:46548 (R;DE;In German)

NIOBIUM 93 TARGET
The role of the viscosity in the hydrodynamic model of high-energetic heavy ion reactions, 14:46548 (R;DE;In German)

NITRATES
See also MERCURY NITRATES
PETN
RUBIDIUM NITRATES
Mathematical modeling of cloud chemistry in the California South Coast Air Basin. Final report, August 1987-December 1988, 14:46093 (R;US)

NITRIC OXIDE
Homogeneous catalysts in hypersonic combustion, 14:45441 (R;US)
Vacuum ultraviolet laser spectroscopy of molecular autoionizing states, 14:46398 (BA;US)

NITRO COMPOUNDS

A shock initiation model for fine-grained hexanitrostilbene, 14:46035 (R;US)

Decomposition kinetics and mechanism of explosive chemicals, 14:46041 (TJ;US)
Estimation of the C-J pressure of explosives, 14:46039 (R;US)
Free-expansion experiments and modeling in detonation: Chemistry and hydrodynamics on a laboratory scale, 14:46028 (R;US)
In-situ study of the chemically driven flow fields in initiating homogeneous and heterogeneous nitromethane explosives, 14:46030 (R;US)

NITROGEN
Characterization and upgrading of coal liquids derived from mild gasification processes, 14:44415 (R;US)

NITROGEN COMPOUNDS
See also NITRATES
NITROGEN OXIDES
Soil nitrogen and ozone effects on growth, physiology, and nutrition of loblolly pine and yellow-poplar seedlings, 14:46091 (R;US)
Use of NMR-NQR on integer spins for nitrogen- and boron containing compound investigation, 14:46607 (RA;SU;In Russian)

NITROGEN DIOXIDE
Studies on air pollution: Effects of nitrogen dioxide on airway caliber and reactivity in asthmatic subjects; effects of nitrogen dioxide on lung lymphocytes and macrophage products in healthy subjects; nasal and bronchial effects of sulfur dioxide in asthmatic subjects. Final report, 26 June 1987-26 November 1988, 14:46327 (R;US)

NITROGEN NITRIDES
See NITROGEN

NITROGEN OXIDES
See also NITRIC OXIDE
NITROGEN DIOXIDE
1989 symposium on stationary combustion nitrogen oxide control: Volume 1, 14:44998 (R;US)
Bench-scale studies to identify process parameters controlling reburning with pulverized coal. Final report, January 1980-December 1983, 14:44445 (R;US)
Method of removing nitrogen monoxide from a nitrogen monoxide-containing gas using a water-soluble iron iondithiocarbamate, xanthate or thioxanthate, 14:45720 (P;US)
Model boiler cost analysis for controlling nitrogen oxides (NOx) emissions from small-steam generating units. Final report, 14:45002 (R;US)
NO_x emission characteristics of industrial burners and control methods under oxygen enriched combustion conditions, 14:45875 (R;US)
NOx emissions from stationary sources in Eastern Europe. Relating NOx emission to the statistical data on fossil fuel consumption and industrial production, 14:46080 (R;NO)
Overview of the regulatory baseline, technical basis, and alternative control levels for nitrogen oxides (NOx) emission standards for small steam generating units. Final report, 14:45001 (R;US)
Strategic high-altitude atmospheric radiation code (SHARC) user instructions. Technical report, September 1987-January 1989, 14:46057 (R;US)

NMR IMAGING
Efficiency analysis of MR-imaging (investigations accompanying clinical tests) - work carried out so far. Interim report, 14:46239 (R;DE;In German)
In-vivo method for determining and imaging temperature of an object/subject from diffusion coefficients obtained by nuclear magnetic resonance, 14:46272 (P;US)

NMR SPECTRA
Applications of NMR spectroscopy to the study of zeolite synthesis, 14:45693 (R;US)
Carbon-13 nuclear magnetic resonance of heterocyclic salts and its precursors, 14:46596 (R;BR;In Portuguese)
Deuterium NMR, induced and intrinsic cholesteric lyomesophases, 14:46406 (R;BR;In Portuguese)
Preparation and spectrometric identification of amide derivatives with antimalaric, 14:46599 (R;BR;In Portuguese)

NMR SPECTROMETERS
Development of nuclear magnetic resonance tomography technology - TORM, 14:45996 (R;BR;In Portuguese)

Differential diagnosis of pathological processes in bram, 14:46258 (RA;SU;In Russian)

PATTERN RECOGNITION
A survey of camera error sources in machine vision systems, 14:45752 (R;US)

PCB
See CHLORINATED AROMATIC HYDROCARBONS

PEAT
Background information of fuel peat, 14:44407 (R;FI;In Finnish)
Bibliography of Finnish biomass and peat literature 1986-1987, 14:44408 (R;FI;In Finnish)
Experiments on the combustion of small peat particles in an entrained-flow, isothermal furnace, 14:44458 (R;FI)
Peat dust deposition in the neighbourhood of peat mining areas, 14:44446 (R;FI;In Finnish)
Peat-Environment-Society; Part 1: Income and employment effects of production and energy use of peat, 14:44460 (R;FI;In Finnish)
Ryholm's peat, 14:44448 (R;SE;In Swedish)

PEATLANDS
See WETLANDS

PEBBLE BED REACTORS
Spherical fuel elements with TRISO particles at accident temperatures. Experimental data to the report Juel-2091 and new results from 1986 to October 1988, 14:45136 (R;DE;In German)
The two-dimensional reactor dynamics program TINTE. Pt. 2. Examples of application, 14:45043 (R;DE;In German)

PELLETS (FUEL)
See FUEL PELLETS

PENTAERYTHRITOL TETRANITRATE
See PETN

PENTOSES
See also XYLOSE
Ethanol fermentation by pichia stipitis of combined pentose and hexose sugars from lignocellulosics prehydrolysed by SO_2 and enzymatically saccharified, 14:44842 (RA;CA)
Hydrolysis of biomass by sulphur dioxide. 2. Recalculation of ethanol yields including pentose fermentation, 14:44850 (RA;CA)

PEOPLE
See HUMAN POPULATIONS

PEP STORAGE RINGS
E^+e^- annihilation at high energies, 14:46475 (R;GB)

PEPTIDES
Tandem mass spectrometry of multiply charged peptides and proteins, 14:45625 (R;US)

PERFORMANCE
Avoiding the disadvantages of overdimensioning of HVAC equipment in operation and restoration, 14:45362 (R;FI;In Finnish)

PERMITS
Hanford Waste Vitrification Plant: Dangerous waste permit application, 14:44709 (R;US)

PERMITTIVITY
Model of confinement for quantum chromodynamics in 2+1 dimensions, 14:46501 (R;BR;In Portuguese)

PERSONNEL
A curriculum model for Nevada Test Site radiation protection technician training, 14:46286 (R;US)
Equation typing: Guidelines for Mass-11 users and others, 14:46737 (R;US)
Occupational radiation exposure at commercial nuclear power reactors and other facilities 1986: Nineteenth annual report, 14:45137 (R;US)

PERTECHNETATES
^{99}Tc and ^{23}Na NMR in polycrystalline sodium and silver pertechnetates, 14:45735 (RA;SU;In Russian)

PESTICIDES
Pesticides in ground-water data base: 1988 interim report, 14:46174 (R;US)

PETN
Crystal orientation effects in PETN explosive with 4 GPa shocks, 14:46031 (R;US)
Estimation of the C-J pressure of explosives, 14:46039 (R;US)
Free-expansion experiments and modeling in detonation: Chemistry and hydrodynamics on a laboratory scale, 14:46028 (R;US)
Laser initiation of secondary explosives: Renlund paper No. 115, 14:46036 (R;US)

PETRA STORAGE RING
E^+e^- annihilation at high energies, 14:46475 (R;GB)

PETROCHEMICAL PLANTS
Diffuse discharges of hydrocarbons from the Statoil Bamble petrochemical plant. Measuring method-measures-effects, 14:44502 (RA;NO;In Norwegian)

PETROLEUM
Allocations
Proposed revisions to the modified proration plan, 14:44525 (R;CA)
Biodegradation
A comparison of Uinta Basin, Utah crude oil and biodegraded products, 14:44423 (R;US)

Carbon Dioxide
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2 - experimental investigations. Final report. Pt. 2, 14:44476 (R;DE;In German)

Compiled Data
Quarterly oil report: Fourth quarter, 1988, 14:45226 (R;US)

Economy
Resource situation in a global perspective, 14:44466 (R;NO;In Norwegian)

Emulsifiers
W/O-emulsion formation and W/O-emulsion stability testing. DIWO report no. 4, 14:44531 (R;NO)

Enhanced Recovery
Capillary effects in steady-state flow in heterogeneous cores, 14:44480 (R;US)
Gas miscible displacement enhanced oil recovery: Technology status report, 14:44481 (R;US)
Nucleation and pore geometry effects in capillary desorption processes in porous media: Topical report, 14:44479 (R;US)

Global Aspects
Resource situation in a global perspective, 14:44466 (R;NO;In Norwegian)

Market
Renewable energy. Offspring of OPEC, 14:45310 (RA;CA)

Meetings
Presentation of low cost contribution to hydrocarbon projects, 14:44485 (R;DK)

Phase Studies
Evaluation of criteria for selection, preparation and performance of field studies on the scope of enhanced oil recovery by technical CO_2 - experimental investigations. Final report. Pt. 2, 14:44476 (R;DE;In German)

Prices
Generating oil price processes from economic arguments, 14:44505 (R;NO)

Production
Federal oil research: A strategy for maximizing the producibility of known US oil, 14:44463 (R;US)

Research Programs
The Petroleum Violation Escrow Remote Bulletin Board System: User's guide, Version 1.1, 14:45228 (R;US)

Resource Potential
Federal oil research: A strategy for maximizing the producibility of known US oil, 14:44463 (R;US)

Statistical Data
International petroleum statistics report, 14:45233 (R;US)
Petroleum supply monthly, 14:45230 (R;US)

Storage
Biogeochemistry of sludge that forms in salt dome caverns used for strategic storage of crude oil, 14:44586 (BA;GB)

Testing
Sampling of reservoir fluids, 14:44532 (R;NO;In Norwegian)

Weathering
W/O-emulsion formation and W/O-emulsion stability testing. DIWO report no. 4, 14:44531 (R;NO)

PETROLEUM COKE
See PETROLEUM PRODUCTS

PETROLEUM DEPOSITS
See also OIL FIELDS
Barents Sea program of IKU (Institutt for Kontinentalsokkelundersoekelser), 14:44495 (RA;NO;In Norwegian)
Reservoir management in field development and production, 14:44492 (RA;NO)

PETROLEUM DISTILLATES
Contamination
Biocides for microbiological contamination control in naval distillate fuel, 14:44545 (BA;GB)
Evaluation and comparison of microbial growth in distillate fuels, 14:44546 (BA;GB)
Microbiological test methods for fuels in the laboratory and on site, 14:44544 (BA;GB)

Performance
Development of reference fuels for use with the ASTM D2274 test for fuel storage stability, 14:44575 (BA;GB)

Stability
Assessing distillate fuel storage stability by oxygen overpressure, 14:44581 (BA;GB)
Comparison of thermodynamics of nitrogen and sulfur compounds implicated in fuel stability problems, 14:44569 (BA;GB)
Development of predictive tests for fuel stability, 14:44578 (BA;GB)
Development of reference fuels for use with the ASTM D2274 test for fuel storage stability, 14:44575 (BA;GB)
Distillate fuel stabilisation in a major European refinery, 14:44564 (BA;GB)
Evaluation of commercial stability additives for naval distillate fuel, 14:44563 (BA;GB)
Middle distillates stability: composition and additive utilization effects on their aging at different temperatures, 14:44565 (BA;GB)
Study of precursors in the formation of insoluble products during the aging of middle distillate fuels, 14:44576 (BA;GB)
Study of variables affecting results obtained in the ASTM D2274 accelerated stability test, 14:44582 (BA;GB)

Storage
Assessing distillate fuel storage stability by oxygen overpressure, 14:44581 (BA;GB)
Development of predictive tests for fuel stability, 14:44578 (BA;GB)
Development of reference fuels for use with the ASTM D2274 test for fuel storage stability, 14:44575 (BA;GB)
Distillate fuel stabilisation in a major European refinery, 14:44564 (BA;GB)
Evaluation and comparison of microbial growth in distillate fuels, 14:44546 (BA;GB)
Evaluation of commercial stability additives for naval distillate fuel, 14:44563 (BA;GB)
Middle distillates stability: composition and additive utilization effects on their aging at different temperatures, 14:44565 (BA;GB)
Study of precursors in the formation of insoluble products during the aging of middle distillate fuels, 14:44576 (BA;GB)
Study of variables affecting results obtained in the ASTM D2274 accelerated stability test, 14:44582 (BA;GB)

PETROLEUM INDUSTRY
Canadian Petroleum Association annual report, 1988, 14:44462 (R;CA;In English and French)
Canadian petroleum industry, 1988 monitoring report. First six months, 14:45236 (R;CA)
Environmental Studies Research Funds annual report, 1988, 14:45235 (R;CA;In English and French)
Index to Ontario Petroleum Institue, Inc. Technical vols. 1 to 26, 14:44465 (R;CA)
NOGAP bibliography, vol.3, 14:44464 (R;CA)
Subsurface disposal of wastes in Manitoba. Part 1: Current status and potential of subsurface disposal of fluid industrial wastes in Manitoba, 14:44508 (R;CA)

PETROLEUM PRODUCTS
See also DIESEL FUELS
FUEL OILS
GAS OILS
GASOLINE
Coating systems for the internal lining of methanol and methanol-containing fuel storage tanks, 14:44535 (BA;GB)
Inground concrete tanks for storage of petroleum products, 14:44595 (BA;GB)
Petroleum marketing monthly, May 1988, 14:44506 (R;US)
Petroleum supply monthly, 14:45230 (R;US)
Quarterly oil report: Fourth quarter, 1988, 14:45226 (R;US)

PETROLEUM REFINERIES
Advanced refinery process heater. Final report, (October 1983-September 1988), 14:44500 (R;US)
SO_2-removal in oil refineries. Mongstad development project, 14:44509 (RA;NO;In Norwegian)

PETROLEUM RESIDUES
Quality of fuels formed by severe hydrotreatment of vacuum residues, 14:44538 (BA;GB)
PETROV-GALERKIN METHOD
See GALERKIN-PETROV METHOD
PHASE CHANGE MATERIALS
Potential industrial applications for composite phase-change materials as thermal energy storage media, 14:45419 (R;US)
PHASE SPACE
Phase space concepts, 14:45926 (BA;US)
PHENOLS
Zooplankton population dynamics in experimentally toxified pond ecosystems, 14:46323 (R;US)
PHILADELPHIA ELECTRIC POWER REACTOR-1
See LIMERICK-1 REACTOR
PHILADELPHIA ELECTRIC POWER REACTOR-2
See LIMERICK-2 REACTOR
PHONONS
Phonon-dislocation interaction in deformed lithium fluoride, 14:45547 (J;US)
PHOSPHINE OXIDES
Chemical characterization of the surface sites of coal: Progress report, December 15, 1988–March 14, 1989, 14:44433 (R;US)
PHOSPHODIESTERASES
Glycation of calmodulin: Chemistry and structural and functional consequences, 14:46213 (J;US)
PHOSPHORUS
Steel impurity element effects on postirradiation properties recovery by annealing: Final report, 14:45491 (R;US)
PHOSPHORUS COMPOUNDS
See also TUNGSTOPHOSPHATES
Structural, optical, and redox properties of lamellar solids derived from copper(1) complexes and n-butylammonium uranyl phosphate and arsenate. Technical report, 14:45583 (R;US)
PHOSPHORYLASES
See PHOSPHOTRANSFERASES
PHOSPHOTRANSFERASES
Detection of two engineered pseudomonads and a spontaneous deletion recombinant derivative in soil using gene probes, 14:44899 (RA;US)
Glycation of calmodulin: Chemistry and structural and functional consequences, 14:46213 (J;US)
PHOTODIODES
Coplanar vacuum photodiode for measurement of short-wavelength picosecond pulses, 14:45830 (BA;US)
PHOTODISINTEGRATION
See PHOTONUCLEAR REACTIONS
PHOTOIONIZATION
All short pulse multiphoton ionization is resonant ionization, 14:46401 (BA;US)
PHOTOLUMINESCENCE
Techniques for the characterization of trace impurities in silicon, 14:45592 (RA;XA)
PHOTOLYSIS
Time-resolved flourescence measurements of KrF emission produced by vacuum ultraviolet photolysis of KrF_2 mixtures, 14:45725 (R;US)
PHOTOMAGNETOELECTRIC EFFECT
See MAGNETIC FIELDS
PHOTON BEAMS
Coherence and statistical properties of photon beams with application to the free-electron laser, 14:45949 (BA;US)
PHOTON COLLISIONS
See also PHOTON-ATOM COLLISIONS
Strategic high-altitude atmospheric radiation code (SHARC) user instructions. Technical report, September 1987-January 1989, 14:46057 (R;US)
PHOTON DETECTION (X-RAY)
See X-RAY DETECTION
PHOTON-ATOM COLLISIONS
Search for multiphoton-induced inner-shell excitations, 14:46413 (J;US)
PHOTONS
Cross-sections for 0.025 eV-1 keV electrons and 10 eV-1 keV photons, 14:46255 (RA;XA)
PHOTONUCLEAR REACTIONS
Development of a vector and tensor polarized deuteron target and measurement of the target asymmetry in the photon-deuteron fission at 450 MeV and 650 MeV photon energy, 14:46514 (R;DE;In German)
PHOTOPRODUCTION
Inclusion of photon production and transport and (e^+e^-) pair production in a particle-in-cell code for astrophysical applications, 14:46375 (R;US)
PHOTOSYNTHESIS
[Evaluation of the North Atlantic seasonal nitrogen model (Version 2)]: Foreign trip report, July 17–21, 1989, 14:46363 (R;US)
[Photosynthesis in intact plants]: Progress report, 14:44891 (R;US)
PHOTOVOLTAIC EFFECT
NASA photovoltaic research and technology, 14:44895 (R;US)
PHYSICAL RADIATION EFFECTS
Effects of cosmic rays on single event upsets. Status report, 14:45563 (R;US)
Simulation of the welding of irradiated materials, 14:45494 (R;US)
PI-1016 RESONANCES
See MESONS
PICEANCE CREEK BASIN
Fracturing along the Grand Hogback, Garfield County, Colorado, 14:44598 (R;US)
PIGE ANALYSIS
See PROTON REACTIONS
PILGRIM-2 REACTOR
Detection and characterization of indications in segments of reactor pressure vessels, 14:45027 (R;US)
PION-PROTON INTERACTIONS
Eta meson production in pion-induced reactions, 14:46437 (R;US)
PIONS
See also PIONS PLUS
A dynamical model of pion photoproduction on the nucleon and its applications, 14:46542 (R;US)
PIONS PLUS
π^+ photoproduction on ^{12}C nucleus with excitaion of ^{12}B nucleus first level, 14:46516 (RA;SU;In Russian)
PIPELINES
See also ALASKA GAS PIPELINE
Applications by Phillips Petroleum Resources, Ltd. for permits to construct pipelines to transport sour gas and fuel gas in the Salter Field. Addendum to Decision 88-4, 14:44609 (R;CA)
Development of an integrated pipeline management system (IPMS), 14:44526 (RA;DK)
Effects of seasonal variations on requirements to prevent corrosion in soils: Final report, 14:44611 (R;US)
Field techniques to determine electrical shorts between carrier pipe and casing pipe: Final report, 14:45750 (R;US)
Oseberg transport project. Experiences from the 1985 investigations, 14:44528 (RA;NO;In Norwegian)
Pipeline connection method and effects on deep water construction operations: Final report, 14:44610 (R;US)
Submarine pipeline on-bottom stability: Volume 1, Analysis and design guidelines: Final report, 14:44612 (R;US)
Transmission operations research status report: 1987 projects, 14:44614 (R;US)
PIPES
Application of remote-control in-pipe inspection technology, 14:45058 (J;US)
Closeout of NRC bulletin 87-01: Thinning of pipe walls in nuclear power plants, 14:45026 (R;US)
Crack growth behavior and modeling: Topical report to Line Pipe Research Supervisory Committee of the Pipline Research Committee of the American Gas Association, 14:45453 (R;US)
Development of ultrasonic testing equipment using electromagnetic acoustic tranducers, 14:45059 (J;US)
Flexible pipe technology, 14:44527 (R;NO)

Investigation of loads generated by temperature transients in pipes, 14:45847 (R;BR)
The role of damage analysis in the assessment of service-exposed components, 14:45473 (R;DE)
Wall thinning in nuclear piping: Status and ASME Section XI activities, 14:45029 (R;US)

PL-1 LANGUAGE
Intelligent mathematical modeling system - MATHMODEL. Final report, 1 August 1988-31 March 1989, 14:46743 (R;US)

PLANETARY ATMOSPHERES
Equation-of-state data of synthetic uranus, 14:46381 (R;US)

PLANNED COMMUNITIES
Decisions relevant to energy conservation on the different levels of municipal development planning, 14:45348 (RA;DE;In German)
Energy-saving and environmentally compatible heating systems in newly erected residential areas, 14:45346 (RA;DE;In German)
Legal basis of energy-saving development plans in Hesse, 14:45347 (RA;DE;In German)
Regional planning requirements of energy-saving development plans, 14:45349 (RA;DE;In German)
Residential development planning in new development areas with a view to energy conservation, 14:45211 (R;DE;In German)
Structural energy conservation measures for new buildings, 14:45345 (RA;DE;In German)

PLANT GROWTH
Assessment of crop response to increases in atmospheric carbon dioxide concentrations: Summary of research progress report, July 1, 1988–June 30, 1989, 14:46073 (R;US)
Environmental and plant effects of sewage sludge application to forests and pastures, 14:46134 (R;US)
Seed bank estimates for the McCowan road simulated right-of-way project, 14:45015 (R;CA)

PLANTS (INDUSTRIAL)
See INDUSTRIAL PLANTS

PLANTS (POWER)
See POWER PLANTS

PLASMA
See also LASER-PRODUCED PLASMA
SOLID-STATE PLASMA
Charge-displacement self-channeling as a method for energy concentration, 14:45826 (BA;US)
On the thermal stability of flow of a radiating two-component plasma in a porous medium between two rotating cylinders, 14:45841 (R;XA)
Plasma physics. Collection, 14:46685 (R;SU;In Russian)
Population inversion through charge exchange process in plasmas, 14:45792 (BA;US)
Studies of a strongly coupled plasma produced in a capillary discharge, 14:46688 (R;US)
Theoretical atomic physics for fusion: Annual report, 1989, 14:46672 (R;US)
Thermodynamical parameters of weakly nonideal supercooled plasma, 14:46687 (RA;SU;In Russian)

PLASMA CONFINEMENT
Current-level triggered plasma-opening switch, 14:46733 (P;US)

PLASMA DIAGNOSTICS
Characteristics of a non-equilibrium picosecond laser plasma, 14:46668 (BA;US)
Characterization of sub-10-μm 30-ps flash duration point sources for x radiography, 14:46700 (J;US)
Observations of high density plasmas produced with a picosecond high power KrF laser, 14:46667 (BA;US)
Plasma-edge diagnostics based on Pd-MOS diodes, 14:46696 (J;NL)

PLASMA DRIFT
Plasma theory and simulation. Quarterly progress report Nos. 1-2, 1 January-30 June 1988, 14:46663 (R;US)

PLASMA INSTABILITY
See also PLASMA MICROINSTABILITIES
Effects of magnetic and collisional viscosity on the E x B gradient drift instability. Memorandum report, 14:46664 (R;US)

PLASMA MICROINSTABILITIES
See also DRIFT INSTABILITY
Hybrid particle-fluid approach to low-frequency turbulence in magnetically confined plasmas, 14:46665 (R;US)

PLASMA SCRAPE-OFF LAYER
PISCES program plasma-surface interactions research: Summary of research, 1988–1989, 14:46724 (R;US)

PLASMA SHEATH
Plasma theory and simulation. Quarterly progress report Nos. 1-2, 1 January-30 June 1988, 14:46663 (R;US)
Studies of the volume and plasma-sheath properties of radio-frequency discharges. Final report, 1 June 1983-28 February 1987, 14:46415 (R;US)

PLASMA SWITCHES
Aurora second single arm tests, 14:45898 (R;US)
Current-level triggered plasma-opening switch, 14:46733 (P;US)
Development and simulation study of a new inverse-pinch high Coulomb transfer switch. Final report, 14:46718 (R;US)

PLASMASPHERE
Study on plasmaspheric electric fields and theirs influences on charged particle dynamics, 14:46385 (R;BR;In Portuguese)

PLASTIC SCINTILLATION COUNTERS
See PLASTIC SCINTILLATION DETECTORS

PLASTIC SCINTILLATION DETECTORS
A measuring facility for the uniformization of the optical readout at the ZEUS calorimeter, 14:45986 (R;DE;In German)
Construction and test of a neutron detector for the PHOENICS experiment, 14:45984 (R;DE;In German)

PLATES
Acceleration of metal plates, 14:45486 (R;US)

PLATES (FUEL)
See FUEL PLATES

PLATINUM
Radiochemical study of biological crisis zones in the fossil record, 14:46358 (BA;US)

PLATINUM COMPLEXES
Concurrent and reversible changes of color and of phase in an aqueous solution of the (2,6-pyridinedicarboxylato)chloroplatinate(II) complex. Spectroscopic and crystallographic studies of the discrete monomer and evidence of a stacked polymer, 14:45715 (J;US)

PLESIOTHERAPY
See RADIOTHERAPY

PLUMES
Heat transfer characteristics of igniter output plumes, 14:45853 (R;US)
Newly designed anticoincidence proportional counter for measuring ^{85}Kr in environmental air samples, 14:46002 (RA;US)

PLUTONIUM
Development of the airborne radioactivity effluent monitoring system for the waste isolation pilot plant, 14:44745 (RA;US)
Remote-controlled NDA [nondestructive assay] systems for process areas in a MOX [mixed oxide] facility, 14:44664 (R;US)

PLUTONIUM 238
Chelation of ^{238}Pu(IV) in vivo by 3,4,3-LICAM(C): Effects of ligand methylation and pH, 14:46318 (J;US)
Radionuclide tracers for the fate of metals in the Savannah estuary: River-ocean exchange processes, 14:46182 (R;US)

PLUTONIUM 239
Photofission cross sections of U-233 and Pu-239 near threshold induced by gamma-rays from thermal neutron capture, 14:46511 (R;BR)
Recent differential low energy cross-sections and thermal evaluations, 14:45063 (RA;XA)

PLUTONIUM 241
Recent differential low energy cross-sections and thermal evaluations, 14:45063 (RA;XA)

PLUTONIUM COMPOUNDS
Calculations in plutonium chemistry: Determination of plutonium oxidation state distributions, 14:45738 (RA;US)

PLUTONIUM DIOXIDE
Using voice input/output in the processing of plutonium, 14:44734 (R;US)

PMMA
Radiation-induced explosive distruction of polymethylmethacrylate under cooling. Model, 14:45558 (RA;SU;In Russian)
PNA
See POLYCYCLIC AROMATIC HYDROCARBONS

The base catalyzed hydrolysis and condensation reactions of dilute and concentrated TEOS [Tetraethylorthosilicate] solutions: Draft, 14:45630 (R;US)
SILICON SEMICONDUCTOR DETECTORS
See SI SEMICONDUCTOR DETECTORS
SILICON SOLAR CELLS
Laser grooved and polycrystalline silicon solar cell research, 14:44903 (R;US)
SILICONES
Polymer radiation curing: epoxies, phenolics, fluorocarbons, and silicones. January 1970-February 1989 (Citations from the NTIS data base). Report for January 1970-February 1989, 14:45565 (R;US)
SILVER
Complex fragments emitted in particle-stable states for the $^{32}S+^{nat}Ag$ reaction at E/A=22.3 MeV, 14:46531 (J;US)
SILVER 109
Precision measurements of the conversion lines intensities by a modernized β-spectrometer UMB-1, 14:45998 (RA;SU;In Russian)
SILVER 110
Environmental radionuclide concentrations in the vicinity of the calvert cliffs nuclear power plant: 1985-1986. Final report, 14:46185 (R;US)
SILVER COMPOUNDS
Synthesis, ESR studies, band electronic structure, and superconductivity in the $(BEDT\text{-}TTF)_2M(NCS)_2$ system (M = Cu, Ag, Au), 14:45577 (J;US)
SILVICULTURE
Environmentally acceptable disposal of wastes from vegetable processing industries, 14:45416 (R;CA)
Research issues: A prospectus for agroforestry, 14:44901 (R;US)
SIMS
See MASS SPECTROSCOPY
SIMULATORS
See also REACTOR SIMULATORS
Validation results for a PC-based binary-cycle geothermal power plant simulator/analyzer, 14:44965 (RA;US)
SIMULATORS (REACTOR)
See REACTOR SIMULATORS
SITE CHARACTERIZATION
Use of Bayesian analysis for incorporating subjective information, 14:44677 (BA;US)
SITE SURVEYS
Hydrogeologic studies for CRNL's proposed shallow land burial site, 14:46181 (R;CA)
SKATING RINKS
Indoor ice arenas. Humidity caused problems and suggested solutions, 14:45367 (R;CA)
SKIN
Swine skin: A model to evaluate dose recovery from different radiations, 14:46215 (BA;US)
SKYRMIONS
See SOLITONS
SLAGS
Interpretation and use of empirical slagging criteria, 14:44453 (RA;US)
Radiative properties of ash and slag: Seventh quarterly report, February 1, 1989–June 30, 1989, 14:44450 (R;US)
SLC
See STANFORD LINEAR COLLIDER
SLIGHTLY ENRICHED URANIUM
Advances in uranium enrichment processes. A challenge to innovation, 14:44671 (R;CA)
SLUDGES
See also SEWAGE SLUDGE
Biogeochemistry of sludge that forms in salt dome caverns used for strategic storage of crude oil, 14:44586 (BA;GB)
Environmental and plant effects of sewage sludge application to forests and pastures, 14:46134 (R;US)
SLUGS (FUEL)
See FUEL RODS
SLURRIES
See also FUEL SLURRIES
Development and characterization of transparent slurries for basic and applied research in solids transport, 14:44449 (R;US)
SLURRIES (FUEL)
See FUEL SLURRIES
SMELTERS
Capsule report: Environmental controls at a secondary lead smelter, 14:46098 (R;US)
SODIUM
Thermal analysis of a mix up sodium tank and its ebb pipeline for SS-050 circuit during a thermal shock, 14:45846 (R;BR;In Portuguese)
SODIUM 30
Beta decay of ^{30}Na: experiment and theory, 14:46520 (R;FR)
SODIUM COOLED REACTORS
See also EBR-2 REACTOR
Integral fast reactor, 14:45147 (RA;US)
Simplified numerical simulation of hot channel in sodium cooled reactor, 14:45051 (R;BR;In Portuguese)
SODIUM IODIDES
Distribution coefficients of microimpurities during crystallization of cesium, sodium iodides from aqueous solutions, 14:45636 (RA;SU;In Russian)
SODIUM IONS
Time development of amplification in Na XI Hα-line at 54.19 Å, 14:45810 (BA;US)
SODIUM MINERALS
See MINERALS
SODIUM SULFATES
Fouling of gas turbine passages, 14:44988 (R;US)
SODIUM-SULFUR BATTERIES
Projected costs for sodium-sulfur electric vehicle batteries, 14:45166 (R;US)

SOFC
See SOLID ELECTROLYTE FUEL CELLS

SOFT X RADIATION
Narrow line x-ray transition radiation by electron beam traversing a solid-state superlattice, 14:45812 (BA;US)
Soft x-ray amplification in a magnetically confined recombining H-like and Li-like plasma, 14:45804 (BA;US)
Studies of hot, solid materials produced by an ultrashort pulse laser, 14:46579 (BA;US)

SOIL CHEMISTRY
Analysis of soil chemistry data for an EPA [Environmental Protection Agency] acid rain assessment, 14:46071 (R;US)

SOIL-STRUCTURE INTERACTIONS
SSI 2D/3D soil structure interaction: A program system for the calculation of structure-soil interactions using the boundary element method. Project C1. Vibrational behaviour of structural components, taking into account soil-structure interactions, 14:45779 (R;DE;In German)

SOILS
Comparison of doses, before and after remedial action, 14:44794 (RA;US)
Cs-137 activity as an index of soil movement under a grazed native pasture at Narayen, Queensland, 14:46125 (RA;AU)
Direct sampling ion trap mass spectrometry for the rapid determination of volatile organics in environmental matrices, 14:46133 (R;US)
Effect of vegetation cover (pine forest vs. no vegetation) on atmospheric desposition and soil acidification, 14:46158 (RA;NO)
Effects of seasonal variations on requirements to prevent corrosion in soils: Final report, 14:44611 (R;US)
Geotechnical investigation at DeCew Falls GS [generating station] Forebay dyke, summer 1987, 14:44884 (R;CA)
Ottawa Carling TS [transformer station]. Grounding system studies, 14:45013 (R;CA)
Proceedings of the national workshop on the use of ^{137}Cs to measure erosion, 14:46124 (R;AU)
Soil and rock classification according to thermal conductivity: Design of ground-coupled heat pump systems: Final report, 14:44945 (R;US)
Two new field measurements for D&D: rapid Th-230 determinations and detection of rad waste in and surrounding sewer or process lines, 14:44801 (RA;US)
Using Cs-137 to assess sheet erosion in Western Australia, 14:46126 (RA;AU)
Variability of caesium-137 in soils, 14:46127 (RA;AU)
Waba Dam. Phase 2, investigation laboratory testing report, 14:44882 (R;CA)

SOL-GEL PROCESS
Preparation of UO_3 sol-gel feedstock, 14:45629 (BA;US)

SOLAR ABSORBERS
Thermografic studies of large absorber fields to record flow disturbances, 14:44925 (RA;DE;In German)

SOLAR ACCESS
Super energy efficient housing and solar orientation. A research report, 14:45423 (R;CA)

SOLAR ACTIVITY
See also SOLAR FLARES
SOLAR RADIO BURSTS
SOLAR WIND
SOLAR X-RAY BURSTS
Detection of CMES (coronal mass ejections) in the interplanetary medium from 1976-1979 using HELIOS-2 photometer data, 14:46365 (R;US)
Observations of coronal mass ejections near the sun, 14:46366 (R;US)
Solar-Geophysical Data Number 531, November 1988. Part 2 (comprehensive reports). Data for May 1988, and miscellaneous, 14:46379 (R;US)

SOLAR ARCHITECTURE
Super energy efficient housing and solar orientation. A research report, 14:45423 (R;CA)

SOLAR BATTERIES
See SOLAR CELL ARRAYS

SOLAR CELL ARRAYS
NASA photovoltaic research and technology, 14:44895 (R;US)

CONCENTRATOR SOLAR CELLS
COPPER SELENIDE SOLAR CELLS
COPPER SULFIDE SOLAR CELLS
GALLIUM ARSENIDE SOLAR CELLS
INDIUM PHOSPHIDE SOLAR CELLS
INDIUM SELENIDE SOLAR CELLS
SILICON SOLAR CELLS
Alternative fabrication techniques for high-efficiency $CuInSe_2$ and $CuInSe_2$-alloy films and cells: Annual subcontract report, 10 November 1987–31 December 1988, 14:44907 (R;US)
$CuInSe_2$ solar cell research by sputter deposition: Final subcontract report, January 1985–November 10, 1987, 14:44908 (R;US)
NASA photovoltaic research and technology, 14:44895 (R;US)

SOLAR COLLECTORS
See also FLAT PLATE COLLECTORS
Avoidance of failures in solar collector system. IEA Task 3: performance testing of solar collectors, Subtask F: service life testing of solar collector components and materials, 14:44936 (R;DK)
Condensation problems with roof-integrated solar collectors in climates in Northern countries, 14:44941 (RA;DK)
Danish export of solar heating technology. Danish produced self-circulating solar heating units, testing - recommendations, 14:44934 (R;DK;In Danish)
Danish export of solar-heating technology. Demands for functional efficiency in the case of solar collectors used in the developing countries, 14:44935 (R;DK;In Danish)
Danish export of solar-heating technology. The market in the Sudan, Senegal and Kenya, 14:44889 (R;DK;In Danish)
Danish solar hot water systems, 14:44931 (R;DK)
Prevention of corrosion-, scale-formation anf fouling-damage in low- and medium temperature closed loop collector systems, 14:44943 (RA;DK)
Proceedings from workshop on service life of solar collector components and materials. IEA Task 3: performance testing of solar collectors, Subtask F: service life testing of solar collector components and materials, 14:44939 (R;DK)
Sunspaces for housing in Finland, 14:45383 (R;FI;In Finnish)

SOLAR CORONA
Detection of CMES (coronal mass ejections) in the interplanetary medium from 1976-1979 using HELIOS-2 photometer data, 14:46365 (R;US)
Filament eruptions and the impulsive phase of solar flares. Report for 18 May 1987-17 May 1988, 14:46364 (R;US)
Observations of coronal mass ejections near the sun, 14:46366 (R;US)
Solar-cycle variation of long-duration 10.7-cm and soft x-ray bursts, 14:46367 (R;US)

SOLAR CYCLE
Observations of coronal mass ejections near the sun, 14:46366 (R;US)
Solar-cycle variation of long-duration 10.7-cm and soft x-ray bursts, 14:46367 (R;US)

SOLAR DOMESTIC WATER HEATING
See SOLAR WATER HEATING

SOLAR ENERGY
Five year research plan: 1989–1993: Solar buildings for a better America: Draft, 14:45186 (R;US)
Solar energy at the Department of Physis, Oslo University, 14:44932 (R;NO;In Norwegian)
Topic seminar HVAC 1988, 14:45199 (R;NO;In Norwegian)

SOLAR FLARES
Filament eruptions and the impulsive phase of solar flares. Report for 18 May 1987-17 May 1988, 14:46364 (R;US)
Solar-Geophysical Data Number 531, November 1988. Part 2 (comprehensive reports). Data for May 1988, and miscellaneous, 14:46379 (R;US)

SOLAR HEATING SYSTEMS
See also PASSIVE SOLAR HEATING SYSTEMS

An operator's experience with a solar heated swimming pool, 14:44927 (RA;DE;In German)
Chances of solar energy in Northern Germany, 14:44923 (RA;DE;In German)

SOLAR RADIATION
Solar-Geophysical Data Number 531, November 1988. Part 2 (comprehensive reports). Data for May 1988, and miscellaneous, 14:46379 (R;US)

SOLAR RADIO BURSTS
Solar-Geophysical Data Number 531, November 1988. Part 2 (comprehensive reports). Data for May 1988, and miscellaneous, 14:46379 (R;US)
Solar-cycle variation of long-duration 10.7-cm and soft x-ray bursts, 14:46367 (R;US)

SOLAR THERMAL TEST FACILITY
See CENTRAL RECEIVER TEST FACILITY

SOLAR WATER HEATERS
High-yield solar heating system with low volume flow. Experimental investigations, 14:44930 (R;DK;In Danish)
Long-term test and technical-scientific advise as assistance to the development and introducing of solar water heaters. Final report, 14:44933 (B;DE;In German)

SOLAR WATER HEATING
Danish solar hot water systems, 14:44931 (R;DK)

SOLAR WIND
Detection of CMES (coronal mass ejections) in the interplanetary medium from 1976-1979 using HELIOS-2 photometer data, 14:46365 (R;US)

SOLAR X-RAY BURSTS
Solar-cycle variation of long-duration 10.7-cm and soft x-ray bursts, 14:46367 (R;US)

SOLID ELECTROLYTE FUEL CELLS
Membrane-based thin layer SOFC components, 14:45316 (R;NL)

SOLID FUELS
See also MIXED OXIDE FUELS
Development of efficiency. Energy mass and mass balance calculation for boilers, 14:44459 (R;FI;In Finnish)

SOLID SOLUTIONS
Near-surface compositional modifications of ternary alloys during sputtering at elevated temperatures, 14:46615 (J;NL)

SOLID STATE LASERS
See also NEODYMIUM LASERS
Laser performance of $LiSrAlF_6:Cr^{3+}$, 14:45837 (J;US)

SOLID WASTES
See also MINERAL WASTES
WOOD WASTES
Energy-directed utilization of refuse, 14:45195 (R;NO;In Norwegian)
Solid and liquid radioactive waste treatment, 14:44731 (R;BR;In Portuguese)
Solid low level waste disposal, 14:44683 (RA;US)
Westinghouse Hanford Company effluent discharges and solid waste management report for calendar year 1988: 200/600 Areas, 14:44769 (R;US)

SOLID-STATE PLASMA
Resonance interaction of surface magnetoplasma polaritons in semiconductor layer, 14:46603 (RA;SU;In Russian)
Time-resolved study of surface recombination at Si(111) surfaces, 14:45554 (BA;US)

SOLIDS
New developments for localized adsorption, 14:46588 (R;XA)
New type of surface acoustic waves in solids due to nonlinear elasticity, 14:46585 (R;XA)

SOLITONS
Davydov solutions at 300 kelvin: The final search, 14:46408 (R;US)

SOURCE ROCKS
Kerogenous and bituminous intercalations within the Hauptdolomit (Upper Triassic, Eastern Alps): Model of a carbonate source rock. Final report, 14:44469 (R;DE;In German)

SOUTH DAKOTA
Uranium roll-front deposits in the southern Black Hills, South Dakota, 14:44634 (RA;XA)

SOVIET UNION

SUPERCONDUCTING FILMS
Preparation of superconducting thick films of $YBa_2Cu_3O_7$ by deposition of a superconducting precursor ink, 14:45545 (J;US)
SUPERCONDUCTING MAGNETS
Beam loss, 14:45910 (BA;US)
Design and operation of the quench protection system for the Fermilab tevatron, 14:45952 (BA;US)
Nuclear Fusion Project. Semi-annual report of the Association KfK/EURATOM. October 1988 - March 1989, 14:46715 (R;DE)
Propagation of normal zones of finite size in large, composite superconductors, 14:46702 (R;US)
Superconducting magnet system, 14:45973 (BA;US)
SUPERCONDUCTING SUPER COLLIDER
Advanced nonlinear theory: long-term stability at the SSC, 14:45972 (BA;US)
Fields, impedances, and structures, 14:45971 (BA;US)
Parameter choices for the SSC, 14:45975 (BA;US)
Rf deflector-chopper for SSC [Superconducting Super Collider] injector, 14:45960 (R;US)
SSC project, 14:45974 (BA;US)
Supercollider physics, 14:45976 (BA;US)
Superconducting magnet system, 14:45973 (BA;US)
SUPERCONDUCTIVITY
Fluxons and order in long Josephson junctions. Final report, 15 November 1985-14 November 1988, 14:45746 (R;US)
Order of phase transition in high temperature superconductivity, 14:46631 (J;US)
SUPERCONDUCTORS
See also TYPE-II SUPERCONDUCTORS
Changes in physical properties of the high-T_c superconductor Y-Ba-Cu-O due to Cu deficiency, 14:45544 (J;US)
Characterization of inhomogeneities in amorphous superconductors, 14:45509 (BA;US)
Evaluation, development, and characterization of superconducting materials for space application. Semiannual progress report No. 2, 14:45562 (R;US)
Interband optical conductivity of $Bi_2CaSr_2Cu_2O_8$, 14:45542 (J;US)
Interim Task Force report on high temperature superconductivity, 14:44986 (R;CA)
Method of creating a large magnetic field in a hollow cylindrical superconducting ring, 14:45782 (P;US)
Model of the isotope effect of the oxide superconductor, 14:46621 (R;XA)
Modified Ginzburg-Landau theory for anisotropic high temperature superconductors, 14:46623 (R;XA)
National Science Foundation annual report, 1988, 14:45198 (R;US)
On the free carrier-negative U center interacting model for the high-T_c oxide superconductor, 14:46622 (R;XA)
On the photoemission spectrum and optical gap in La_2CuO_4, 14:46629 (R;US)
Possible high T_c superconductivity in the Ba-La-Cu-O system, 14:46508 (BA;US)
Studies of novel superconductors: Progress report, January 1, 1989–December 31, 1989, 14:46620 (R;US)
SUPERCONVERGENCE RELATIONS
On the superconvergence of the SBB method, 14:46654 (R;BR)
SUPERCRITICAL FLOW
See TURBULENT FLOW
SUPERCRITICAL FLUID CHROMATOGRAPHY
Research and development opportunities in supercritical fluid technology: Final report, 14:45400 (R;US)
Supercritical fluid chromatography: Application of a new technique for analysis and materials characterization: Final report, 14:45621 (R;US)
SUPERCRITICAL GAS EXTRACTION
Research and development opportunities in supercritical fluid technology: Final report, 14:45400 (R;US)
SUPERFLUID MODEL
Solitons in Gross-Pitaevskii equation, 14:46554 (R;BR;In Portuguese)
SUPERFUND
Biological treatment of leachate from a Superfund site, 14:46142 (R;US)
DOE environmental compliance policy perspectives and priorities, 14:45180 (RA;US)
NEPA/CERCLA compliance at the Weldon Spring Site Remedial Action Project (WSSRAP), 14:44793 (RA;US)
Superfund Record of Decision (EPA Region 2): Montgomery Township Housing Development, New Jersey (second remedial action), June 88. Final report, 14:46188 (R;US)
Superfund Record of Decision (EPA Region 3): Middletown Air Field, Pennsylvania (first remedial action), December 1987, 14:45426 (R;US)
Superfund Record of Decision (EPA Region 4): Independent Nail, Beaufort, Beaufort County, South Carolina (second remedial action), August 1988. Final report, 14:45418 (R;US)
Superfund Record of Decision (EPA Region 7): Fulbright/Sac River Landfill, Missouri (first remedial action), September 1988. Final report, 14:46153 (R;US)
SUPERLATTICES
Narrow line x-ray transition radiation by electron beam traversing a solid-state superlattice, 14:45812 (BA;US)
SUPERNOVAE
The shocking development of lithium (and boron) in supernovae, 14:46378 (R;US)
SUPERSONIC FLOW
A parallel numerical simulation for supersonic flows using zonal overlapped grids and local time steps for common and distributed memory multiprocessors, 14:46418 (R;US)
SUPERSYMMETRY
CP-violation in SUSY, 14:46459 (RA;JP)
Construction of two dimensional super potentials for classical super systems, 14:46484 (R;XA)
Stable supermembrane vacuum with a discrete spectrum, 14:46494 (R;XA)

SURRY-2 REACTOR
THREE MILE ISLAND-2 REACTOR
TROJAN REACTOR
ZION-1 REACTOR
Nuclear data for the calculation of thermal reactor reactivity coefficients - A brief introduction, 14:45061 (RA;XA)

THERMIONIC EMITTERS
A 2-MeV microwave thermionic gun, 14:45967 (R;US)

THERMOCOUPLES
Experimental determination of the fluid velocity by spectral analysis of temperature fluctuations, 14:45844 (R;BR;In Portuguese)
The Pt/Au thermocouple, 14:46021 (R;CA)
Using self-calibrating thermocouples in industry, 14:46012 (R;US)

THERMOELECTRIC CELLS
See THERMOELECTRIC GENERATORS

THERMOELECTRIC CONVERTERS
See THERMOELECTRIC GENERATORS

THERMOELECTRIC GENERATORS
Iron disilicide thermoelectric generator. Final report, 1 August 1988-15 April 1989, 14:45314 (R;GB)

THERMONUCLEAR DEVICES
Development of elemental techniques for in-vacuum remote manipulators of fusion devices, 14:46711 (RA;XA)
Maintenance approach and remote equipment design for FER, 14:46706 (RA;XA)

THERMONUCLEAR IGNITION
Ignition probabilities for Compact Ignition Tokamak designs, 14:46689 (R;US)

THERMONUCLEAR POWER PLANTS
Remote maintenance concepts for nuclear plants, 14:46708 (RA;XA)
Towards more automation for remote maintenance, 14:46712 (RA;XA)

THERMONUCLEAR REACTIONS
Atomic and molecular data activities for fusion in the IAEA Nuclear Data Section, 14:46256 (RA;XA)
Heavy-ion scattering near the Coulomb barrier: Some recent developments, 14:46543 (R;US)
Massachusetts Institute of Technology Plasma Fusion Center, 1988–1989 report to the President, 14:46678 (R;US)
Review of computer applications in the Magnetic Fusion Energy Theory Program, 14:46670 (R;US)

THERMONUCLEAR REACTOR MATERIALS
Control of water absorption by purification of graphite, 14:46730 (J;NL)
Nuclear Fusion Project. Semi-annual report of the Association KfK/EURATOM. October 1988 - March 1989, 14:46715 (R;DE)
Workshop on the effects of recoil spectrum and nuclear transmutations on the evolution of the microstructure: Foreign trip report, March 22, 1988–March 28, 1988, 14:46720 (R;US)
[US/Japan collaborative program using the High Flux Isotope Reactor (HFIR) for irradiation of fusion reactor structural materials]: Foreign trip report, February 14, 1988–February 20, 1988, 14:46719 (R;US)

THERMONUCLEAR REACTORS
See also LASER FUSION REACTORS
Boundary effects on the MHD dynamo in laboratory plasmas, 14:46671 (R;US)
Radioactive waste disposal for fission and fusion reactors, 14:46721 (R;US)
Upgrade of a fusion accident analysis code and its application to a comparative study of seven fusion reactor designs, 14:46703 (R;US)

THERMONUCLEAR WEAPONS
See NUCLEAR WEAPONS

THERMOPILES

THIOBACILLUS FERROXIDANS
Electrochemistry of Thiobacillus ferrooxidans reactions with pyrite: Technical progress report, April 15–August 15, 1989, 14:44421 (R;US)

THIOCYANATES
Synthesis, ESR studies, band electronic structure, and superconductivity in the $(BEDT\text{-}TTF)_2M(NCS)_2$ system (M = Cu, Ag, Au), 14:45577 (J;US)

THIOCYANIDES
See THIOCYANATES

THIOLS
Kinetics analysis of thio-alcohol on the fixed bed of activated carbon, 14:46084 (RA;US)

THIRD-HARMONIC GENERATION
See HARMONIC GENERATION

THORIUM
Correlated electron-positron emission in heavy-ion collisions, 14:46402 (R;DE)
Spectra of lead, bismuth, thorium and uranium relevent to a neodymium-like soft x-ray lasing scheme, 14:45808 (BA;US)

THORIUM 230
Solvent extraction technique for the analysis of thorium-230 using the Photon-Electron Rejecting Alpha Liquid Scintillation Spectrometer (PERALS), 14:45585 (RA;US)
Status report vicinity property remedial action standards, verification and certification, 14:44797 (RA;US)
Two new field measurements for D&D: rapid Th-230 determinations and detection of rad waste in and surrounding sewer or process lines, 14:44801 (RA;US)

THORIUM 232
Results of the radiological survey at 126 West Central Avenue, Maywood, New Jersey (MJ038), 14:46149 (R;US)
Results of the radiological survey at 275 Eccleston Place, Maywood, New Jersey (MJ045), 14:46152 (R;US)
Results of the radiological survey at 35 West Fairmont Avenue, Maywood, New Jersey (MJ040), 14:46151 (R;US)
Results of the radiological survey at the Electric Substation on West Central Avenue, Maywood, New Jersey (MJ039), 14:46150 (R;US)

THORIUM D
See LEAD 208
THREADED JOINTS
Guidelines for threaded-fastener application in nuclear power plants: Final report, 14:45070 (R;US)
THREE MILE ISLAND-2 REACTOR
TMI-2 B-loop steam generator tube sheet loose debris examination and analysis, 14:45083 (R;US)
TIDAL POWER
Prediction of post barrage densities of shorebirds. V. 2. Sediments, 14:44973 (R;GB)
TIN
Study of electric resistivity in function of temperature in $Ni_2Mn(Sn_{1-x}\ In_x)$ type Heuster alloys, 14:45471 (R;BR;In Portuguese)
TIN 110 TARGET
Nuclear shapes from charged-particle γ-ray angular correlations, 14:46530 (BA;US)
TIN 114 TARGET
Nuclear shapes from charged-particle γ-ray angular correlations, 14:46530 (BA;US)
TIN ALLOYS
Ion implantation of two titanium alloys, 14:46609 (R;US)
TIN COMPLEXES
ODMR in 2 ero field-new approch to coordination compound photoexcited states, 14:46606 (RA;SU;In Russian)
TIN ISOTOPES
Anomalous odd- to even-mass isotope ratios in resonance ionization with broad-band lasers, 14:45707 (J;US)
Heavy-ion induced transfer reactions as a probe of high-spin collective states in nuclei, 14:46534 (BA;US)
Theory of resonant ionization by broad-band radiation in the determination of isotopic abundances, 14:45708 (J;US)
TIN OXIDES
Homogeneous catalysts in hypersonic combustion, 14:45441 (R;US)
TISSUE-EQUIVALENT MATERIALS
Ionization yield for low energy photons and electrons absorbed in tissue-equivalent gas mixtures, 14:46246 (RA;XA)
TITANIUM
Heat transfer characteristics of igniter output plumes, 14:45853 (R;US)
TITANIUM ALLOYS
See also TITANIUM BASE ALLOYS
Fatigue crack growth-microstructural relationship of Ti-6Al-4V. Final report, September 1987-June 1988, 14:45452 (R;US)
TITANIUM BASE ALLOYS
Ion implantation of two titanium alloys, 14:46609 (R;US)
The isothermal fatigue behavior of a unidirectional SiC/Ti composite and the Ti alloy matrix, 14:45561 (R;US)
TITANIUM BORIDES
Process for fabrication of large titanium diboride ceramic bodies, 14:45550 (P;US)
TITANIUM CHLORIDES
Role of free radicals in hydroprocessing of coal liquids, 14:44442 (J;US)
TITANIUM COMPLEXES
Synthesis and structures of bimetallic titanium and chromium carbene complexes of the type $Cp_2Ti(Cl)O(CH_3)CCr(CO)_5$, 14:45709 (J;US)
TITANIUM HYDRIDES
Consequence of condensed-phase formation in transient burning of $TiH_x/KClO_4$ in a closed system, 14:45726 (R;US)
TITANIUM IONS
Dielectronic excitation and recombination in crystal channels, 14:46575 (R;US)
Experimental study of the x-ray transitions in the heliumlike isoelectronic sequence, 14:46691 (J;US)
VUV amplification of neon-like titanium ion, 14:45813 (BA;US)
TITANIUM OXIDES
Activation of hydrous titanium oxide-supported catalysts for HYD [hydrogenation], HDS [hydrodesulfurization], and HDO [hydrodeoxygenation] reactions, 14:44428 (R;US)
Mechanistic and kinetic studies of high-temperature coal gas desulfurization sorbents: Quarterly technical progress report No. 4, April–June 1989, 14:44443 (R;US)
TMPN
See ORGANIC OXYGEN COMPOUNDS
TNT
Estimation of the C-J pressure of explosives, 14:46039 (R;US)
Free-expansion experiments and modeling in detonation: Chemistry and hydrodynamics on a laboratory scale, 14:46028 (R;US)
TOBACCO SMOKES
Asbestos: chronic health effects. September 1987-July 1989 (Citations from the Life Sciences Collection data base). Report for September 1987-July 1989, 14:46103 (R;US)

RANGER DEPOSIT
Age Estimation
Age determination of basement units in the Key Lake uranium deposit area, Saskatchewan, Canada, 14:44652 (RA;XA)
Comparative Evaluations
Similarities and differences between unconformity-spatially related uranium deposits from Aveyron, France, and Saskatchewan, Canada, 14:44644 (RA;XA)
Diagenesis
Alteration halo characteristics of uranium deposits in the Athabasca Basin, northern Saskatchewan, 14:44646 (RA;XA)
Diagenesis and ore deposition in sandstone-hosted uranium-vanadium deposits in the Colorado Plateau: Evidence from fluid inclusions, 14:44636 (RA;XA)
Exploration
Lead and uranium isotopes in groundwaters around the Cigar Lake uranium deposit (Saskatchewan, Canada): Preliminary results, 14:44650 (RA;XA)
Geochemistry
Basement geochemistry and possible links between 'Beaverlodge' and 'Athabasca' type uranium mineralization, 14:44641 (RA;XA)
Geothermal analyses of the breccia pipes (Arizona) - Organic matter, fluid inclusions, fission tracks and computerized modeling, 14:44637 (RA;XA)
Graphite disordering during the Gneissic basement alteration in the Saskatchewan uranium deposits (Canada), 14:44647 (RA;XA)
Hydrogeochemistry and uranium fixation in the Cigar Lake uranium deposit, northern Saskatchewan, 14:44649 (RA;XA)
Regional lithogeochemistry of the eastern part of the Athabasca Basin uranium province, Saskatchewan, Canada, 14:44639 (RA;XA)

Geologic History
Conceptual genetic models for important types of uranium deposits and areas favourable for their occurrence in Canada, 14:44627 (RA;XA)
Flodelle Creek surficial uranium deposit, Stevens County, Washington, USA, 14:44638 (RA;XA)
Hematite-enriched sandstones and chromium-rich clays - Clues to the origin of vanadium-uranium deposits in the Morrison Formation, southwestern Colorado and southeastern Utah, USA, 14:44635 (RA;XA)
Review of genetic models for major types of uranium deposits in the USA, 14:44628 (RA;XA)
Thrust-induced consanguinity in diverse genetic types of uranium deposits: North American and other examples, 14:44629 (RA;XA)
Uranium deposits in the Beaverlodge area, northern Saskatchewan: their relationship to the Martin Group (Proterozoic) and the underlying basement, 14:44640 (RA;XA)

Geologic Models
Conceptual model for development of megabreccias and associated mineral deposits in Wernecke Mountains, Canada, Copperbelt, Zaire, and Flinders Range, Australia, 14:44631 (RA;XA)

Geologic Structures
Eagle Point uranium deposits, northern Saskatchewan, Canada, 14:44656 (RA;XA)
Kiggavik (Lone Gull): An unconformity related uranium deposit in the Thelon basin, northwest territories, Canada, 14:44655 (RA;XA)

Great Lakes
Blind River (Elliot Lake) uranium deposits, 14:44630 (RA;XA)

Meetings
Uranium resources and geology of North America. Proceedings of a technical committee meeting held in Saskatoon, Canada, 1-3 September 1987, 14:44625 (R;XA)

Metamorphic Rocks
Formation of infiltration-type uranium deposits associated with granitic and metamorphic basement complexes - Exploration guidelines, 14:44632 (RA;XA)

Mineralogy
Detailed mineralogy and alteration of the Swanson uranium deposit, southern Virginia, USA, 14:44660 (RA;XA)
Swanson uranium deposit, Pittsylvania County, Virginia, USA: Stratigraphy, petrology and ore mineralogy, 14:44658 (RA;XA)

Mining
Albitite-type uranium mineralization in the Nonacho basin area, northwest territories, Canada, 14:44657 (RA;XA)

Orogenesis
Alteration parageneses of the Helikian sandstone and the Aphebian basement of the Key Lake mine and other uranium deposits in the eastern Athabasca basin (Saskatchewan, Canada), 14:44651 (RA;XA)
Geology and genesis of the Athabasca basin uranium deposits, 14:44645 (RA;XA)

Radiometric Surveys
Swanson uranium deposit, Virginia: A structurally controlled, U-P albitite deposit, 14:44659 (RA;XA)

Sandstones
Green Mountain uranium district, Central Wyoming: Type locality of solution front limb deposits, 14:44633 (RA;XA)

X-Ray Fluorescence Logging
Uranium roll-front deposits in the southern Black Hills, South Dakota, 14:44634 (RA;XA)

URANIUM DIOXIDE
Air oxidation of UO_2 fuel. Chalk River studies, 14:45045 (R;CA)

URANIUM HEXAFLUORIDE
Infrared spectra of UF_6, WF_6 and MoF_6 molecules in solutions of loquified rare gases, 14:45733 (RA;SU;In Russian)
Reactions of aluminum with uranium fluorides and oxyfluorides, 14:44662 (R;US)

URANIUM IONS
Correlated electron-positron emission in heavy-ion collisions, 14:46402 (R;DE)

URANIUM ISOTOPES
See also URANIUM 233

WIPP
Feasibility Study: Applicability of geochronologic methods involving radiocarbon and other nuclides to the groundwater

hydrology of the Rustler Formation, southeastern New Mexico, 14:44767 (R;US)
WIPP welder for remotely handled transuranic waste overpack, 14:44780 (J;US)

WOOD
Continuum-mechanical derivation of the conservation equations for the pyrolysis and combustion of wood, 14:44875 (R;FI)
Further development of processes for the conversion of wood to liquid fuels through the operation of a continuous/semi-continuous liquefaction unit, 14:44914 (R;CA)
Manufacture and use of tar, 14:44870 (R;FI;In Finnish)
Particle size of fuel chips made by landing chippers, 14:44874 (R;FI;In Finnish)
Ultrapyrolysis of cellulose and wood components, 14:44917 (R;CA)

WOOD ALCOHOL
See METHANOL

WOOD BURNING FURNACES
An overview of control systems for wood fired boilers, 14:44862 (RA;CA)
Emission test results, 14:44866 (RA;CA)
Fuel handling systems for wood-fired heating plants, 14:45877 (RA;CA)
PAH (Polycyclic Aromatic Hydrocarbons), dust and mutagenicity in flue gases from wood firing in a tile stove, 14:45381 (R;NO;In Norwegian)
The combustion cell and boiler, 14:44861 (RA;CA)
Wood-fired boiler workshop, 14:44860 (R;CA)

WOOD FUELS
Energy forestry fuel for the combined power and heating plant in Lund, 14:44912 (R;SE;In Swedish)
Financing options for energy projects, 14:45308 (RA;CA)
Small-medium fuelwood chipping, 14:44865 (RA;CA)
The socio-economic impact of wood energy use in the province of New Brunswick, 14:45176 (RA;CA)
Wood energy in perspective, 14:45307 (RA;CA)
Wood energy symposium proceedings, 14:44864 (R;CA)
Wood: a fuel for the future in New Brunswick, 14:44863 (RA;CA)

WOOD PRODUCTS INDUSTRY
Pentachlorophenol: health and environmental effects profile, 14:46330 (R;US)

WOOD WASTES
Develop a novel biomass catalysed pretreatment and hydrolysis for cosolvent fuel butanol and ethanol fermentation. Volume 1, 14:44839 (R;CA)
Develop a novel biomass catalysed pretreatment and hydrolysis for cosolvent fuel butanol and ethanol fermentation. Volume 2, 14:44840 (R;CA)
Ethanol fermentation by pichia stipitis of combined pentose and hexose sugars from lignocellulosics prehydrolysed by SO_2 and enzymatically saccharified, 14:44842 (RA;CA)
Hydrolysis of biomass by sulphur dioxide, 14:44858 (RA;CA)
Hydrolysis of biomass by sulphur dioxide. 2. Recalculation of ethanol yields including pentose fermentation, 14:44850 (RA;CA)
SO_2-catalysed prehydrolysis of coniferous wood for ethanol production, 14:44854 (RA;CA)
SO_2 pretreatment for high yield ethanol production, 14:44852 (RA;CA)

WOOD-FUEL POWER PLANTS
Cariboo woodwaste study, 14:44992 (R;CA)
Design and operation of a 7.2 MW wood waste co-generation plant. A case history, 14:44867 (RA;CA)

WORKERS
See PERSONNEL

WORKING FLUIDS
See also REFRIGERANTS
Heat-transfer and friction factor design data for all-metal compact heat exchangers. Summary report, January 1985-November 1987, 14:45748 (R;US)

WYOMING
Green Mountain uranium district, Central Wyoming: Type locality of solution front limb deposits, 14:44633 (RA;XA)

X

X RADIATION
See also SOFT X RADIATION
Charge-displacement self-channeling as a method for energy concentration, 14:45826 (BA;US)
Diffraction contrast of a Bragg-Fresnel lens in white and monochromatic radiation, 14:46635 (BA;US)
X-ray optics for x-ray laser research applications, 14:45831 (BA;US)

X-2830 RESONANCES
See MESONS

X-RASERS
See X-RAY LASERS

X-RAY DETECTION
Sub-nanosecond, photon counting, imaging, x-ray camera, 14:46014 (BA;US)

X-RAY DIFFRACTION
Addiction compounds of lanthanide methanesulfonates and yttrium and N,N-dimethylacetamide, 14:45598 (R;BR;In Portuguese)
Addition compounds of lanthanide trifluoromethanessulfonates (III) and yttrium (III) and N,N,N',N' tetramethyladipamide, 14:45597 (R;BR;In Portuguese)

X-RAY LASERS
Coherent Radiation
Proposed method for the measurement of the spatial coherence of laboratory x-ray lasers, 14:45829 (BA;US)

Design
Calculation and design of Ni-like W soft x-ray lasers, 14:45805 (BA;US)
Compact x-ray free-electron laser, 14:45822 (BA;US)
High power, short pulse ultra-violet laser for the development of a new x-ray laser, 14:45803 (BA;US)
Non-reciprocity of autoionizing interferences: Lasers without inversion, 14:45832 (BA;US)
Research in x-ray optics with the ultimate aim of constructing a synchrotron radiation pumped soft x-ray lithium laser: Final report, 14:45833 (R;US)
Soft x-ray lasing of Li-like ions in laser-produced plasmas, 14:45809 (BA;US)

Laser Materials
Targets for efficient femtosecond-time-scale x-ray generation, 14:45823 (BA;US)

Laser Radiation
Gain guided x-ray beams, 14:45798 (BA;US)

Plasma Density
Density gradient free electron collisionally excited X-ray laser, 14:45838 (P;US)

Research Programs
Ne-like ion x-ray laser experiments in plasmas produced by 0.53-μm and 0.35-μm laser light, 14:45800 (BA;US)
Probability of soft x-ray radiation for 3p-3s transition in neon-like iron, 14:45796 (BA;US)
Progress towards a 44-Å x-ray laser, 14:45785 (BA;US)
Short wavelength lasers: Something new, something old, 14:45789 (BA;US)
Soft x-ray amplification in a magnetically confined recombining H-like and Li-like plasma, 14:45804 (BA;US)
Spectra of lead, bismuth, thorium and uranium relevent to a neodymium-like soft x-ray lasing scheme, 14:45808 (BA;US)
Time development of amplification in Na XI Hα-line at 54.19 Å, 14:45810 (BA;US)
X-ray emission studies of sub-picosecond laser produced plasmas, 14:45820 (BA;US)
X-ray laser related experiments and theory at Princeton, 14:45790 (BA;US)
X-ray laser research at Physics International, 14:45814 (BA;US)
X-ray optics for x-ray laser research applications, 14:45831 (BA;US)

Soft X Radiation
Capillary discharge plasmas as extreme ultraviolet laser sources, 14:45801 (BA;US)

X-ray laser experiment with double pass device and long-recombing-plasma column, 14:45788 (BA;US)

X-RAY SOURCES
The production of long coherence-length hard x-rays using nuclear Bragg scattering of synchrotron radiation, 14:46578 (BA;US)

X-RAY SPECTROMETERS
Observational techniques for solar flare gamma-rays, hard X-rays, and neutrons. Final report, 1 November 1983-30 November 1988, 14:46001 (R;US)

XENON
Multiphoton ionization with femtosecond laser pulses, 14:46395 (BA;US)
Parabolic mirror electron energy analyzer for multiphoton photoemission spectroscopy, 14:46397 (BA;US)
Radioactive noble gas adsorption and irradiation studies, 14:45095 (RA;US)
Symmetries and asymmetries in above-threshold ionization, 14:46394 (BA;US)

XENON FLUORIDES
Ion-enhanced chemical reaction of XeF_2 with silicon by modulated molecular beam mass spectrometry, 14:46611 (BA;US)

XENON IONS
Production, transport and charge capture measurements of highly charged recoil ions, 14:45994 (R;DE)

XUV
See EXTREME ULTRAVIOLET RADIATION

XYLOSE
Acetone-butanol fermentation of xylose and sugar mixtures, 14:44857 (RA;CA)
Ethanol and sugar tolerance of candida shehatae, 14:44846 (RA;CA)
Production of acetone-butanol by extractive fermentation using dibutylphthalate as extractant, 14:44848 (RA;CA)
Recent advances in xylose and cellobiose fermentation, 14:44841 (RA;CA)

Y

Y*RESONANCES
See BARYONS

Y-12 PLANT
A field lysimeter demonstration to evaluate land burial of wastes containing depleted uranium, 14:44694 (RA;US)
Contamination control projects in 9206 Facility, 14:44812 (R;US)

YEASTS
See also CANDIDA
Adaptation of Candida shehatae and Pichia stipitis to wood hydrolysates for increased ethanol production, 14:44856 (RA;CA)
Isoenzyme and protein patterns of pentose-fermenting yeasts after adaptation to wood hydrolysates, 14:44844 (RA;CA)

YTTERBIUM 151
Doorway-state formation and structure in β-delayed proton decay, 14:46535 (J;US)

YTTERBIUM 164
Nuclear shapes from charged-particle γ-ray angular correlations, 14:46530 (BA;US)

YTTERBIUM 174 TARGET
Nuclear shapes from charged-particle γ-ray angular correlations, 14:46530 (BA;US)

YTTERBIUM COMPLEXES
Effect of ClO_4^- anions on Yb(3) induced paramagnetic shifts in PMR spectra of aqua-acidocomplexes in water-acetone solutions, 14:45655 (RA;SU;In Russian)
NMR spectra and structure of lanthanide complexes with water-soluble porphyrins, 14:45667 (RA;SU;In Russian)
On the LiCl effect on NMR spectra of Yb(3) complex with L-histidine, 14:45656 (RA;SU;In Russian)

YTTRIUM ALLOYS
Interim evaluation of the thermal stability of $Cu_{0.67}Y_{0.25}Kr_{0.08}$ sputter deposits, 14:44753 (RA;US)

YTTRIUM ALUMINIUM GARNETS
See ALUMINIUM OXIDES
YTTRIUM COMPOUNDS

YTTRIUM COMPOUNDS
See also YTTRIUM OXIDES
YTTRIUM TUNGSTATES
Defect structures preceding amorphization by ion irradiations in $YBa_2Cu_3O_{7-\delta}$, 14:45522 (R;US)
Temperature dependence of critical current and I-V characteristics in the $YBa_2Cu_3O_7$(y) and $Bi_2S_2CaCu_2O_8$(Bi) ceramics, 14:46628 (RA;SU)
Transient Josephson effect on Y-Ba-Cu-O film at T=4.2 K, 14:46624 (RA;SU;In Russian)

YTTRIUM OXIDES
A study of the tribological and surface micromechanical properties of $YBa_2Cu_3O_{7-x}$: Final report, 14:45538 (R;US)
Changes in physical properties of the high-T_c superconductor Y-Ba-Cu-O due to Cu deficiency, 14:45544 (J;US)
Effect of microstructure on mechanical properties of silicon nitride ceramics: Final report for period April 1, 1984 through March 31, 1988, 14:45525 (R;US)
Intergranular and interphase boundaries in ceramics, 14:45534 (R;US)
Magnetization of $YBa_2Cu_3O_{7-x}$ ceramics after irradiation with carbon relativistic nuclei, 14:46626 (RA;SU;In Russian)
Preparation of superconducting thick films of $YBa_2Cu_3O_7$ by deposition of a superconducting precursor ink, 14:45545 (J;US)
Stabilization of high-temperature superconductor $Y_1Ba_2Cu_3O_{7-\delta}$ surface, 14:46627 (RA;SU)
Synthetic and structural studies on the formation of a tetradecametallic yttrium oxide alkoxide chloride complex: An example of how molecular yttrium oxygen frameworks from extended arrays, 14:45716 (J;US)
Thermionic Insulator Development and Evaluation (TIDE): Final report, 14:45526 (R;US)

YTTRIUM TUNGSTATES
PMR in the study of structure and thermal stability of group 3 element paratungstates, 14:45657 (RA;SU;In Russian)

YUCCA MOUNTAIN
Draft reclamation program plan for site characterization: Yucca Mountain project, 14:44715 (R;US)

YUKON TERRITORY
Recommendations for the investigation of northern Canadian oil shale deposits, 14:44620 (R;CA)
Yukon and Northwest Territories historical water levels summary, to 1985, 14:44878 (R;CA;In English and French)
Yukon and Northwest Territories historical water levels summary, to 1987, 14:44880 (R;CA;In English and French)

Z

Z PINCH DEVICES (LINEAR)
See LINEAR Z PINCH DEVICES

ZAIRE REPUBLIC
Conceptual model for development of megabreccias and associated mineral deposits in Wernecke Mountains, Canada, Copperbelt, Zaire, and Flinders Range, Australia, 14:44631 (RA;XA)

ZEOLITES
Applications of NMR spectroscopy to the study of zeolite synthesis, 14:45693 (R;US)

ZINC
Effects of heavy metals in sediments on the macroinvertebrate community in the Short Creek/Empire Lake aquatic system, Cherokee County, Kansas: A recommendation for site-specific criteria. Technical report (Final), 14:46328 (R;US)
Micromechanisms of surface friction in zinc electrogalvanized steel sheets, 14:45488 (R;US)

ZINC 65
Environmental radionuclide concentrations in the vicinity of the calvert cliffs nuclear power plant: 1985-1986. Final report, 14:46185 (R;US)

ZINC CHLORIDES
Studies of the initial reactions that occur during direct coal liquefaction, 14:44427 (R;US)

ZINC COMPOUNDS
See also ZINC OXIDES
ZINC SELENIDES
ZINC SULFIDES
A 50-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized-bed gasification system: Annual technical progress report, September 1987–September 1988, 14:44419 (R;US)

ZINC OXIDES
Mechanistic and kinetic studies of high-temperature coal gas desulfurization sorbents: Quarterly technical progress report No. 4, April–June 1989, 14:44443 (R;US)
Surface rotational phonons on the cleavage faces of tetrahedrally coordinated compound semiconductors, 14:45578 (J;US)

ZINC SELENIDES
Surface rotational phonons on the cleavage faces of tetrahedrally coordinated compound semiconductors, 14:45578 (J;US)

ZINC SULFIDES
Surface rotational phonons on the cleavage faces of tetrahedrally coordinated compound semiconductors, 14:45578 (J;US)

ZINC-BROMINE BATTERIES
Preparation and evaluation of composite membranes for zinc/bromine storage batteries, 14:45167 (R;US)

ZION STATION UNIT-1
See ZION-1 REACTOR

ZION-1 REACTOR
Field studies on intergranular attack: Final report, 14:45038 (R;US)

ZIRCONIUM
Multiple-scattering Green-function method for space-filling cell potentials, 14:46619 (J;US)

ZIRCONIUM 90
Gamma decay studies of giant resonances, 14:46536 (BA;US)

ZIRCONIUM 90 TARGET
Neutron cross section measurements using the Oak Ridge electron linear accelerator: Performance report, July 1988–July 1989, 14:46525 (R;US)

ZIRCONIUM ALLOYS
Characterization of inhomogeneities in amorphous superconductors, 14:45509 (BA;US)
Evidence for the formation of a metastable crystalline phase during crystallization of Zr-Ni metallic glasses of approximately 57-63.2 at. % Zr*, 14:45507 (BA;US)
Neutron scattering studies of amorphous Invar alloys, 14:45458 (R;US)
Thermodynamics and kinetics of crystal-amorphous transformation in $A_{1-x}B_x$ alloys during reaction with hydrogen, 14:45508 (BA;US)

ZIRCONIUM OXIDES
^{31}P NMR study of organic phosphorus compounds complexing with the surfaces of porous materials, 14:45683 (RA;SU;In Russian)

Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

Contract No.	Abstract No.	Report No.
AC01-85CE10509	**Meridian Corp., Alexandria, VA (USA)**	
	14:45209	DOE/CE/10509–H2
AC01-86MA00356	**Hay Group, Washington, DC (USA)**

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Codes Used on Index Lines

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;In Russian). The language designator does not appear if the document is published in English.

ORDER FORM

DOE and DOE contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ ZIP _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ ZIP _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no. _____

☐ Check/Money Order enclosed for $ _____

☐ Charge to my ☐ American Express ☐ VISA ☐ MasterCard

_____ _____
Account Number Card expiration date

☐ Ship & Bill (see below for restrictions)

Employer identification number (9 digits) __ __ - __ __ __ __ __ __ __

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
National Technical Information Service
5285 Port Royal Road
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

IV. SELECTIONS

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
